# STEAM, MUCH MORE THAN AN ACRONYM

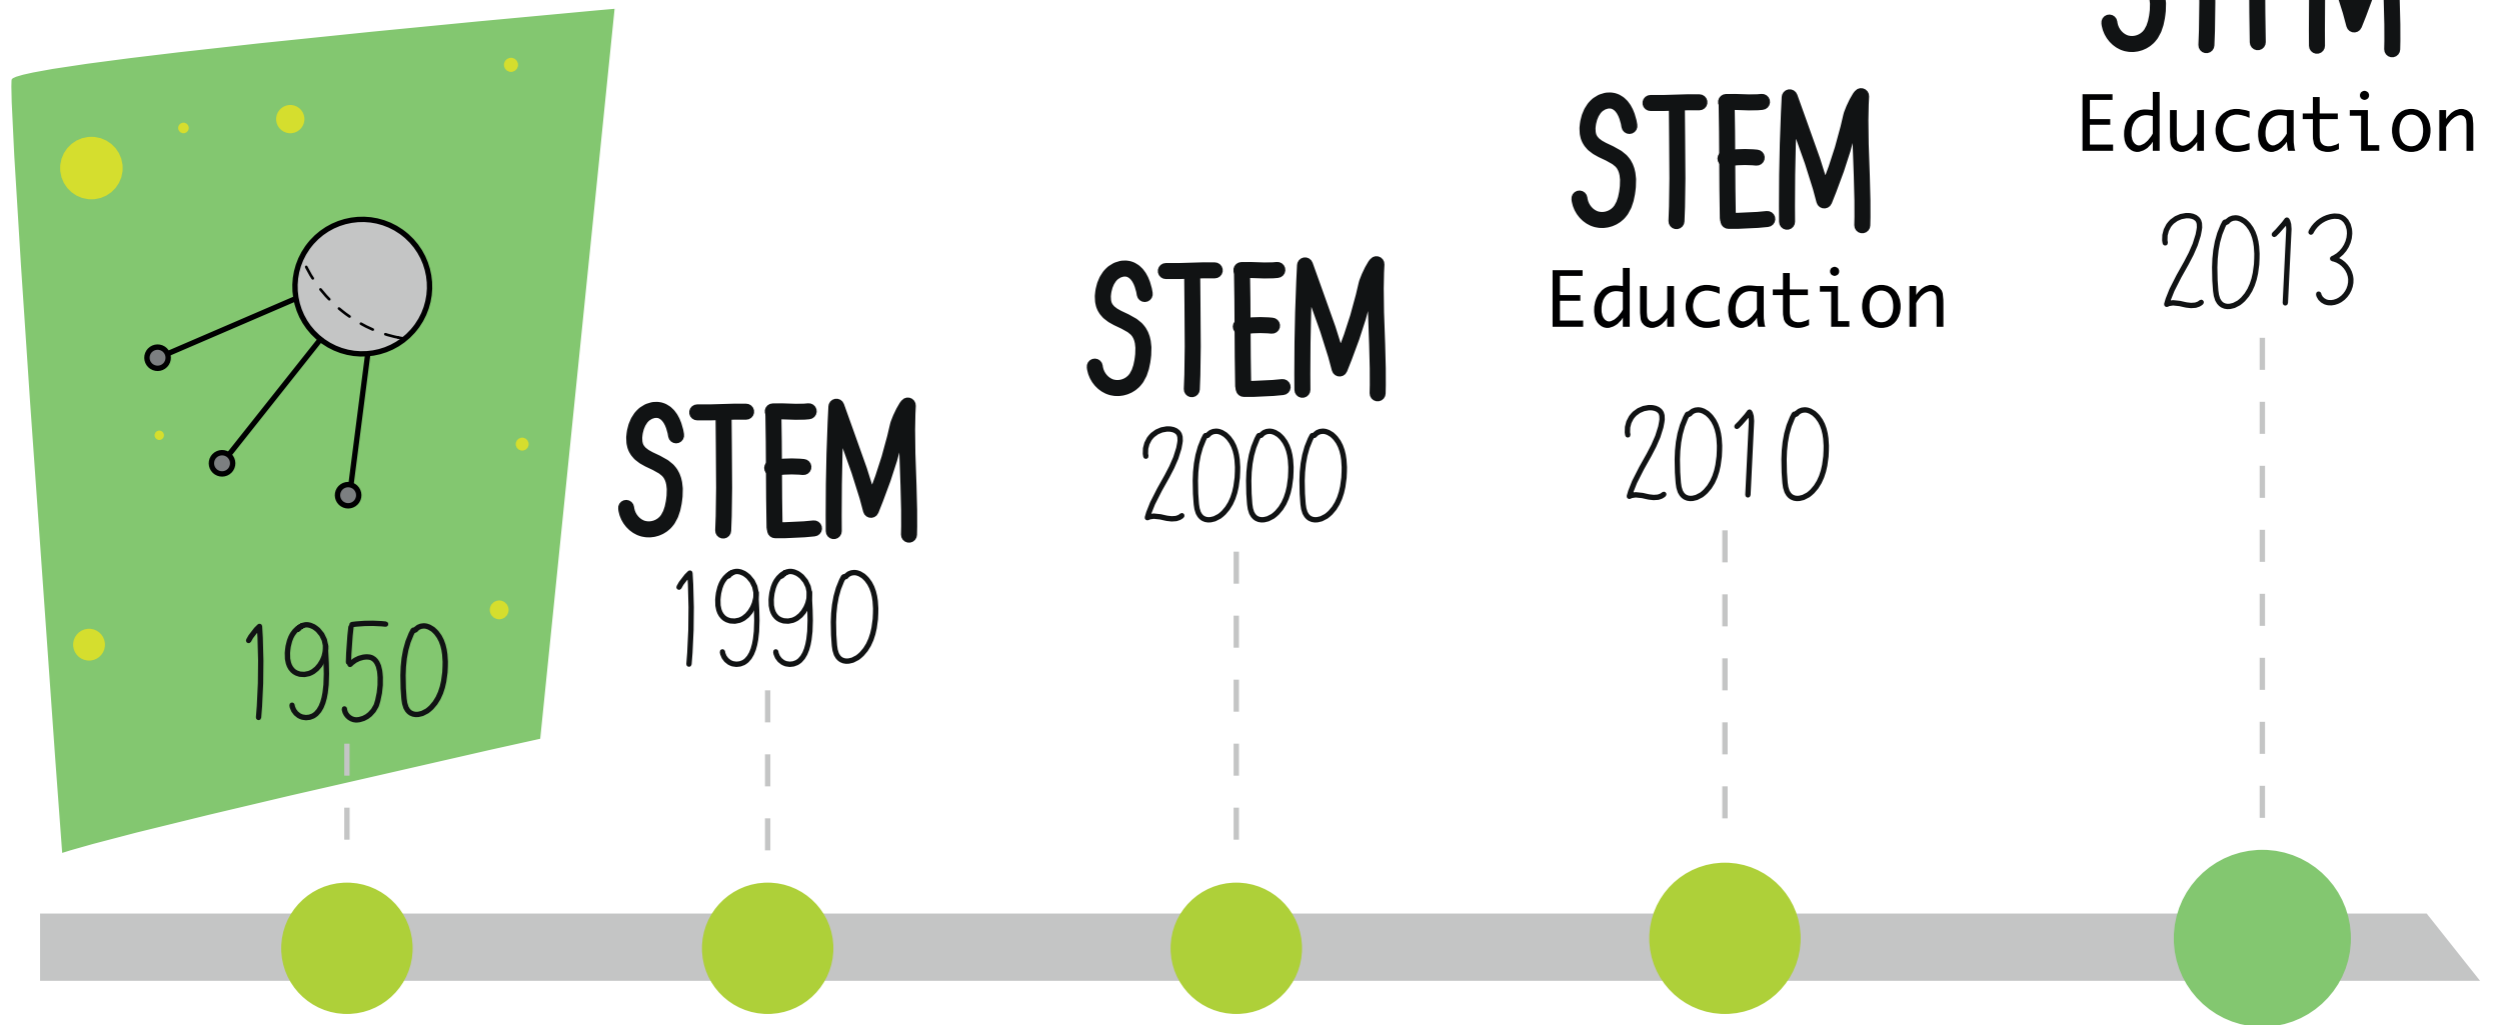

# **STEAM, MUCH MORE THAN AN ACRONYM**

- **The origin of STEAM**
- **STEM and STEAM, some differences**
- **STEAM education**
- **STEAM education, myths**

# The origin of STEAM

From the 1950s to the present

**Source:** Science and Mathematics Education Research Centre (CRECIM) of the Autonomous University of Barcelona (UAB).

# STEM and STEAM, some differences

**STEAM:** Science, Technology, Engineering, Arts, Mathematics.

**The letter A, for Arts, has different meanings.** Initially it stood for Arts, but it now represents the integrative perspective of all the disciplines.

STEAM education is focused on the practical application of theoretical knowledge. Thus, much importance has been given to the engineering perspective and to developing solutions to technological problems.

**STEM professions:** these are professions directly related to science, technology, engineering and mathematics. Health sciences and social sciences are sometimes included among STEM professions, and sometimes not.

# What is STEAM EDUCATION

**STEAM**  
SCIENCE  
TECHNOLOGY  
ENGINEERING  
ARTS  
MATHEMATICS

**VISION OF  
OBJECTIVES** and  
**ACTIVE  
METHODOLOGIES**

# Myths about STEAM education

- ✗ STEAM education is nothing more than a change of methodology.
- ✗ For teachers, changing the methodology is simple and can be done immediately.
- ✗ With project work, teachers do not need to give theoretical explanations.
- ✗ STEAM is applicable to all disciplines.
- ✗ Students don't learn as much with project work.
- ✗ All students prefer project work.
- ✗ Students have to work with total autonomy.
- ✗ With project work, the most important thing is doing experiments.
- ✗ Formative assessments are widely used in formal education.

# WHY STEAM?

# WHY STEAM?

- **Objective: an active and critical community**
- **Need for STEM professionals in the future**
- **What do young people (from the Basque Country) say?**
- **A sustainable world through STEAM education**
- **Responsible research and innovation**
- **Experiences and community**
- **STEAM Euskadi strategy**

# Why STEAM?

Facing the  
**CHALLENGES**  
of the world,

focusing  
on **VALUES**

# Need for STEM professionals in the future

## Demand for STEM professionals

- In the future, 80% of jobs will require STEM skills
- STEM professionals are needed in all economic sectors
- Need for professionals in the EU: ICT, doctors, STEM teachers, etc.

Economía | La falta de profesionales amenaza el futuro del pujante sector tecnológico de Euskadi

### La falta de profesionales amenaza el futuro del pujante sector tecnológico de Euskadi

APORTACIÓN POR ÁREAS AL CONJUNTO DE OFERTAS DE EMPLEO EN EL SECTOR TIC

Las TIC, que generan el 5% del PIB vasco y más de 20.000 empleos directos, ofrecen contratos estables y un potencial «extraordinario»

MIKEL MADINABEITIA

Domingo, 9 junio 2019, 07:38

# Decline in STEM vocations

- **Strict requirements for entry to university**
- **High dropout rate**
- **Low participation of women**
- **Brain drain” abroad or to other areas of work**
- **Low appeal**
- **Highly stressful work environments**
- **Fall in salaries**

ELMUNDO

OLGA R. SANMARTÍN Jueves, 19 diciembre 2019

EDUCACIÓN · Informe

**Los universitarios matriculados en carreras tecnológicas caen un 30% porque "no compensa el esfuerzo"**

El presidente de los rectores advierte que "sin suficientes ingenieros, matemáticos, físicos o químicos nos quedaremos fuera de la Revolución 4.0 y seremos tecnológicamente dependientes"

# Situation in the Basque Country

In 2030,  
**10% fewer children**  
in the classroom  
(up to 16 years).

**54%**  
of High School  
students choose  
scientific-technological  
training.

Since 2016,  
**16% fewer**  
students have enrolled  
in STEM studies.

**39% of vocational training  
and university students**  
obtain a STEM qualification

**Female students  
in STEM disciplines:**

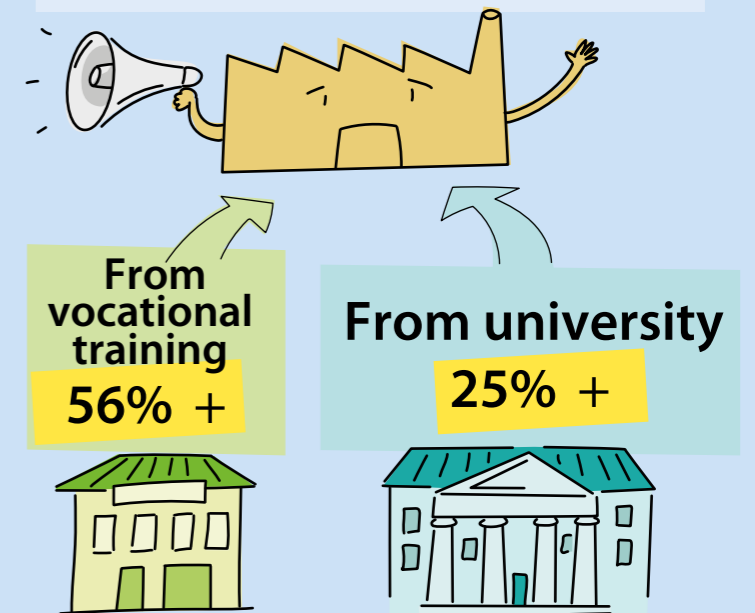

Vocational  
training,  
**9%**  
of the total.

University,  
**31%**  
of the total.

Between 2018 and 2020,  
companies demanded  
more STEM profiles

# STEAM in Europe

- In 2017, 59% of scientists and engineers were men and 41% were women.
- Men were particularly overrepresented in high- and medium-level industrial manufacturing (83% men), while the services sector was more balanced (55% men and 45% women).

- However, in five EU member states, the majority of scientists and engineers were women:

Lithuania (57%)

Bulgaria and Latvia (53%)

Portugal (51%) and

Denmark (50%)

- Women scientists and engineers accounted for less than a third in: Hungary and Luxembourg (25%), Finland (29%) and Germany (33%).

Source: *Eurostat*.

[ec.europa.eu/eurostat](http://ec.europa.eu/eurostat)

# STEAM in Europe

## Women scientists and engineers

In 2017, 18 million scientists and engineers in the EU

TECHNOLOGY INDUSTRIAL MANUFACTURING

SERVICES SECTOR

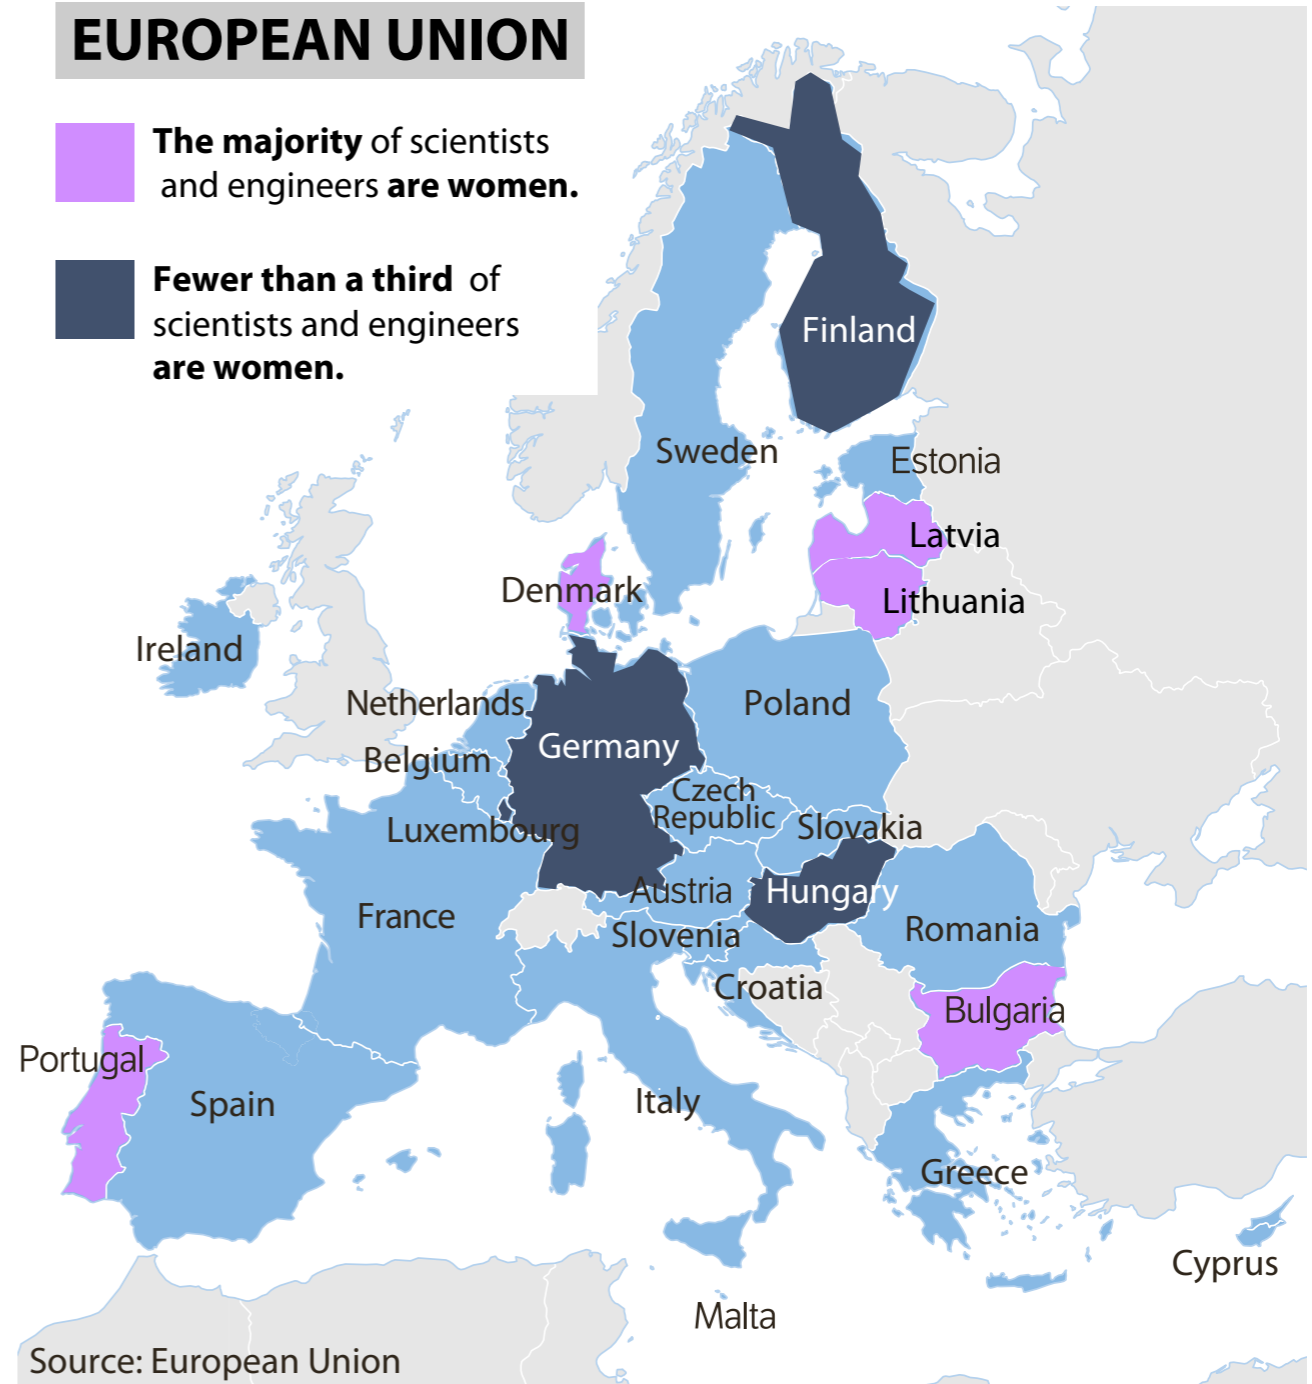

Men  
Women

### EUROPEAN UNION

**The majority of scientists and engineers are women.**

**Fewer than a third of scientists and engineers are women.**

Source: European Union

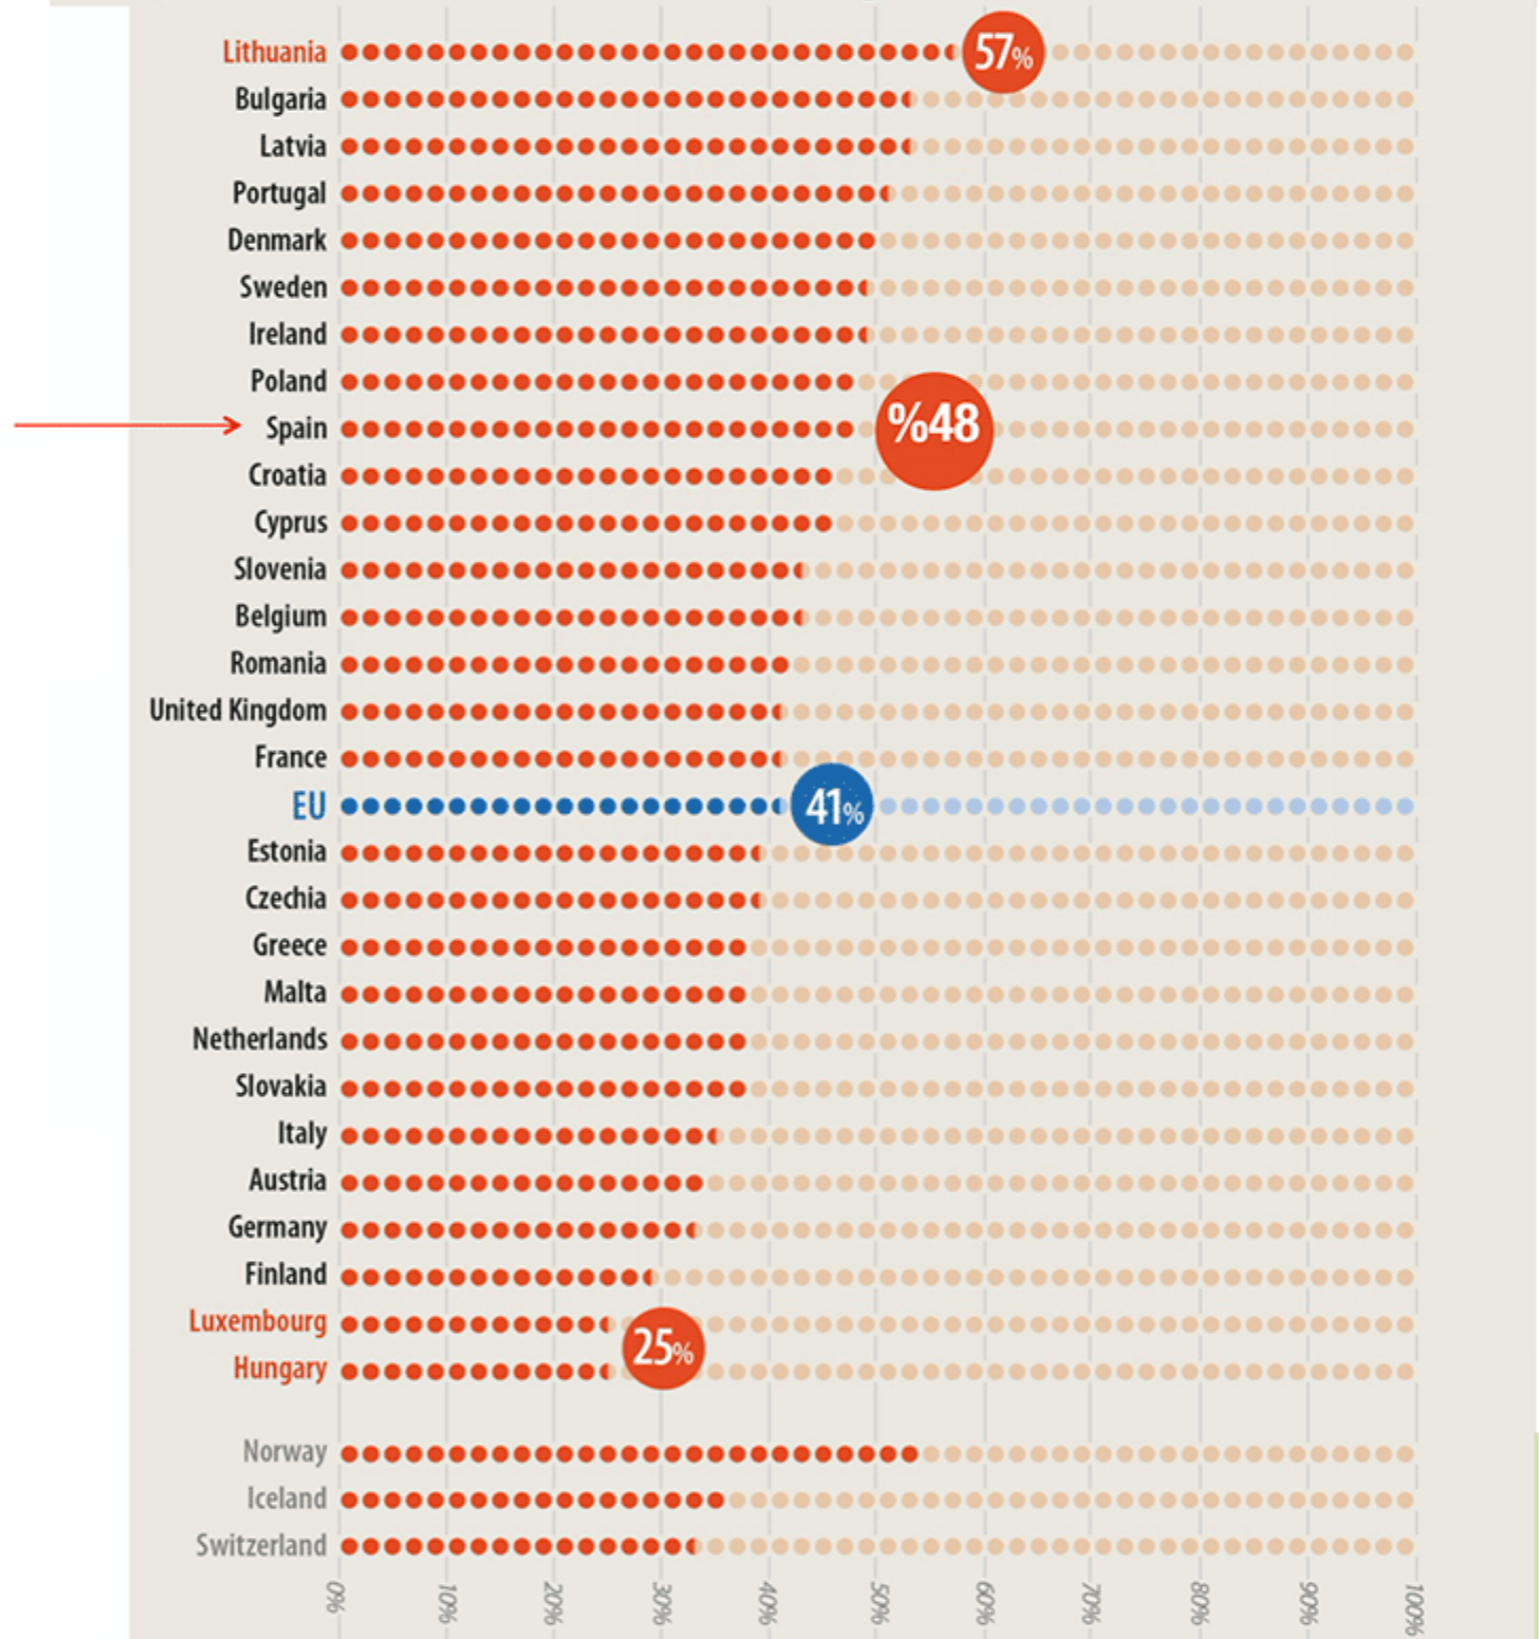

Source: Scientists and engineers in the EU (2017). [ec.europa.eu/eurostat](http://ec.europa.eu/eurostat).

# STEAM in Europe

## Women scientists and engineers by country

### Proportion of women scientists and engineers in the EU (2017)

Source: Scientists and engineers in the EU (2017). [ec.europa.eu/eurostat](http://ec.europa.eu/eurostat).

# Why STEAM?

## What do young people (from the Basque Country) say?

Girls show more interest in more subjects.

Half of young people don't know the industry of the region

and they don't care.

Boys have more focused interests.

### Quality of life of STEM professionals

### Stereotypes of STEM professionals

Hard-working

Wise

Intelligent

Very patient

Creative

Words to describe good students!

### Gender stereotypes when choosing a profession

• Girls:  
Health Sciences  
and  
Teaching

• Boys:  
Technology

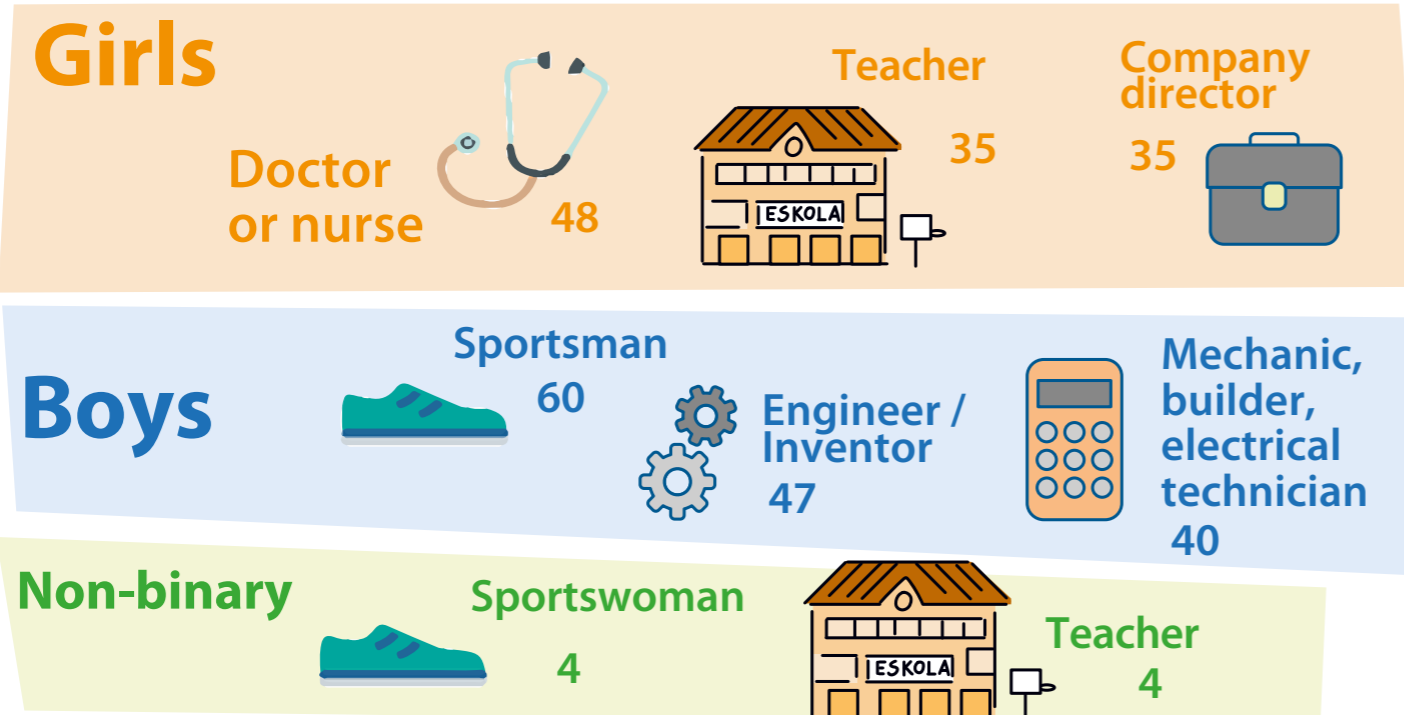

Young people believe that working conditions in STEM are different according to gender.

Note:  
No global data has been extracted for non-binary people.

Source:  
"STEAM arloko gaien eta lanbideen inguruko gazteen pertzepzioak".  
Elhuyar.

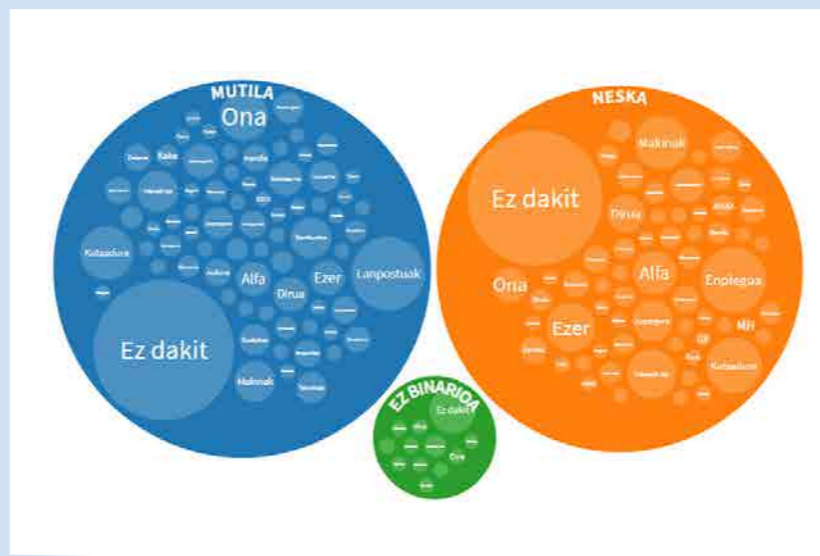

# What would you like to be when you grow up?

## Key aspects for reflection and future research:

- Specialised jobs in the Basque Government's RIS Euskadi, primarily for boys?
- Do girls go into public administration?
- 84% of 3rd-4th year ESO are clear about what they want to study (and what they don't). (Everis)
- The main factor when deciding is the father or the mother, ahead of the media. (Everis)

Asked to describe in one word the main INDUSTRY OF THE REGION, the most common response was ***"I don't know"***: 83 boys (31%), 76 girls (30%) and 9 non-binary (42%).

# A more sustainable world through STEAM education

## UNESCO and Sustainable Development Goals

## 1. No poverty

**Goal:**  
End poverty in all its forms everywhere

## 2. Zero hunger

**Goal:**  
End hunger, achieve food security and improved nutrition, and promote sustainable agriculture

## 3. Good health and well-being

**Goal:**  
Ensure healthy lives and promote well-being for all at all ages.

## 4. Quality education

**Goal:**  
Ensure inclusive and equitable quality education and promote lifelong learning opportunities for all.

## 5. Gender equality

**Goal:**  
Achieve gender equality and empower all women and girls.

## 6. Clean water and sanitation

**Goal:**  
Ensure availability and sustainable management of water and sanitation for all.

## 7. Affordable and clean energies

**Goal:** Ensure access to affordable, reliable, sustainable and modern energy for all.

## 9. Industry, innovation and infrastructure

**Goal:** Build resilient infrastructure, promote inclusive and sustainable industrialisation and foster innovation.

## 11. Sustainable cities and communities

**Goal:** Make cities and human settlements inclusive, safe, resilient and sustainable.

## 8. Decent work and economic growth

**Goal:** Promote sustained, inclusive and sustainable economic growth, full and productive employment and decent work for all.

## 10. Reduced inequalities

**Goal:** Reduce inequality within and among countries.

## 12. Responsible consumption and production

**Goal:** Ensure sustainable consumption and production patterns.

## 13. Climate action

**Goal:**  
Take urgent action to combat climate change and its impacts.

## 15. Life on land

**Goal:**  
Protect, restore and promote sustainable use of terrestrial ecosystems, sustainably manage forests, combat desertification, and halt and reverse land degradation and halt biodiversity loss.

## 17. Partnerships for the goals

**Goal:**  
Strengthen the means of implementation and revitalise the Global Partnership for Sustainable Development.

## 14. Life below water

**Goal:**  
Conserve and sustainably use the oceans, seas and marine resources for sustainable development.

## 16. Peace, justice and strong institutions

**Goal:**  
Promote peaceful and inclusive societies for sustainable development, provide access to justice for all and build effective, accountable and inclusive institutions at all levels.

## Technology is more accessible

Moreover, we must consider the factor of commercialisation of consumer technologies.

# Responsible research and innovation

Six action lines have been established for Responsible Research and Innovation (RRI):

- **Ethics.** Focuses on the ethics of science. Its aim is to prevent unacceptable practices and to work for the ethical acceptance of scientific advances.

- **Governance.** Responsibility must be shared among all. For this, society must be offered instruments of governance that make shared responsibility a reality.

- **Science education.** Science education must be improved so that citizens can make decisions, by working on vocations.

- **Gender equality.** Promote gender equality in research groups so that decision-making bodies accurately reflect society.

- **Free access to data.** Free access to science, to provide more opportunity for interacting and developing together.

- **Citizen participation.** Promote citizen participation throughout the research process, so that the results are more aligned with the values, needs and desires of society.

[See ZientziaKIDE.](#)

# Experiences and community

With regard to choosing studies, according to research by **Aspires**:

Liking STEAM is not enough.

Key age for working on vocations:  
**10-14 years.**

Increasingly difficult after that!

Studying STEAM is not just for being a scientist.

Prejudices, stereotypes and **false beliefs** about science.

To empower young people, give them a **realistic** view of STEAM content.

The importance of the **family** and the **social environment** in increasing **scientific capital**.

## ...CREATE EXPERIENCES!

The factors that influence the choice of STEAM studies are divided into five groups (see **Ingenious**):

### 1 Personal environment

- Avoid false beliefs.
- Self-perception.
- Overcome the narrow view of science.

### 2 Family environment

- Science capital of family members.
- STEM workers in the family.

### 3 Social environment

Scientific perspective in leisure products and in the media.

### 5 The economic context

### 4 Educational environment

- Teaching methodologies.
- Orientation in education.

...involve the whole **COMMUNITY**

Creating  
STEAM  
experiences

with the support  
of the whole  
community

EXPERIENCES  
AND  
COMMUNITY

Students

Professionals

Families

Experts

Society

Laboratories

Universities

# STEAM Euskadi strategy

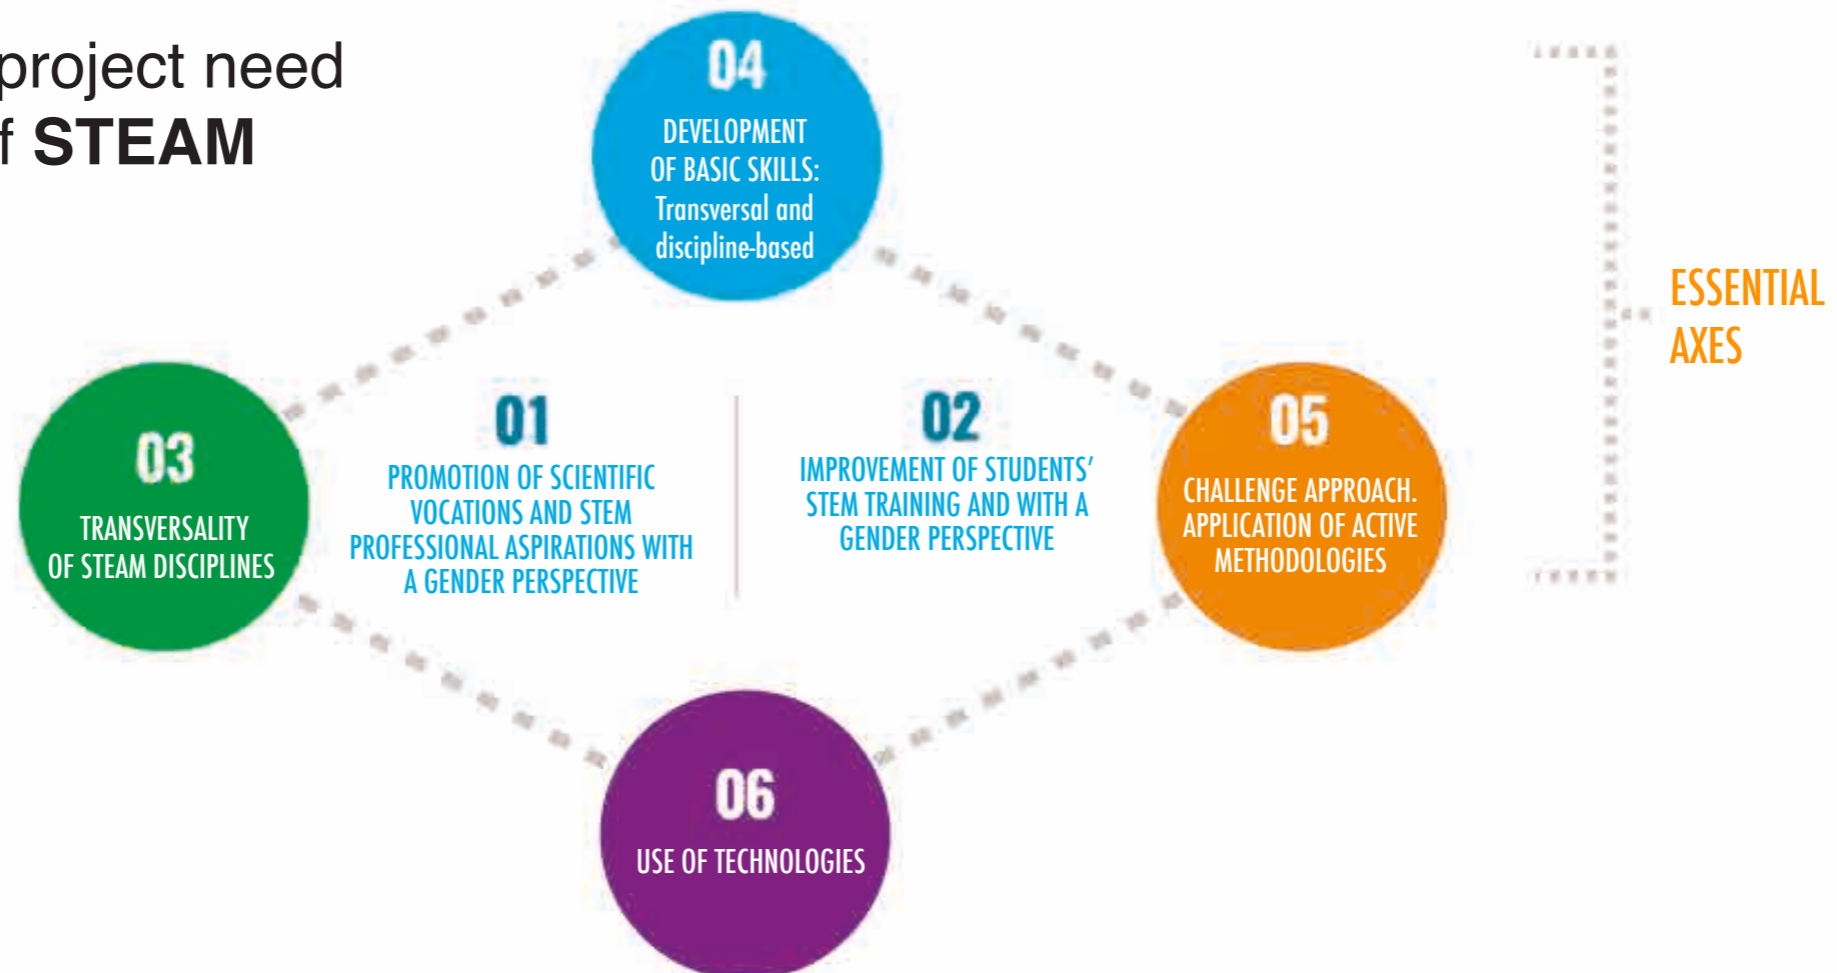

- **steam.eus**
- **Educational and professional strategy of the Basque Government. Presented in June 2018.**
- **Combines science, technology, engineering and mathematics with arts and the humanities, with an emphasis on interdisciplinarity.**
- **Education based on key STEM skills and transversal skills.**
- **Seeks to empower students to meet the challenges of our society.**

## Objectives of the STEAM Euskadi strategy:

- 1.- To promote scientific and technical education and foster partnerships and collaborative work with socio-economic agents.
- 2.- To encourage professional aspirations in the STEM field, with a particular focus on gender.
- 3.- To promote scientific and technological culture among citizens.

What does a project need to form part of **STEAM** education?

# STEAM EDUCATION IN SCHOOLS

# STEAM EDUCATION IN SCHOOLS

- **Knowledge of science.**

- **What do we need to know about science?**

- **What does the research say about science education?**

**Schools in the Basque Country.**

- **STEAMGUNEA.**

# Science knowledge

*Science is an intellectual creation for analysing nature.*

## SCIENCE OF SCIENTISTS

Knowledge + Theory  
+ Methodology +  
+ Thought

## LABORATORIES OF SCIENTIFIC PERSONNEL

Spaces designed for asking questions, for research and innovation.

**SCIENCE IN SCHOOL**  
Presented as a seamless truth.

Theoretical knowledge.

Often focused on numerical exercises.

Mistakes made in the past usually not shown.

## SCHOOL LABORATORIES

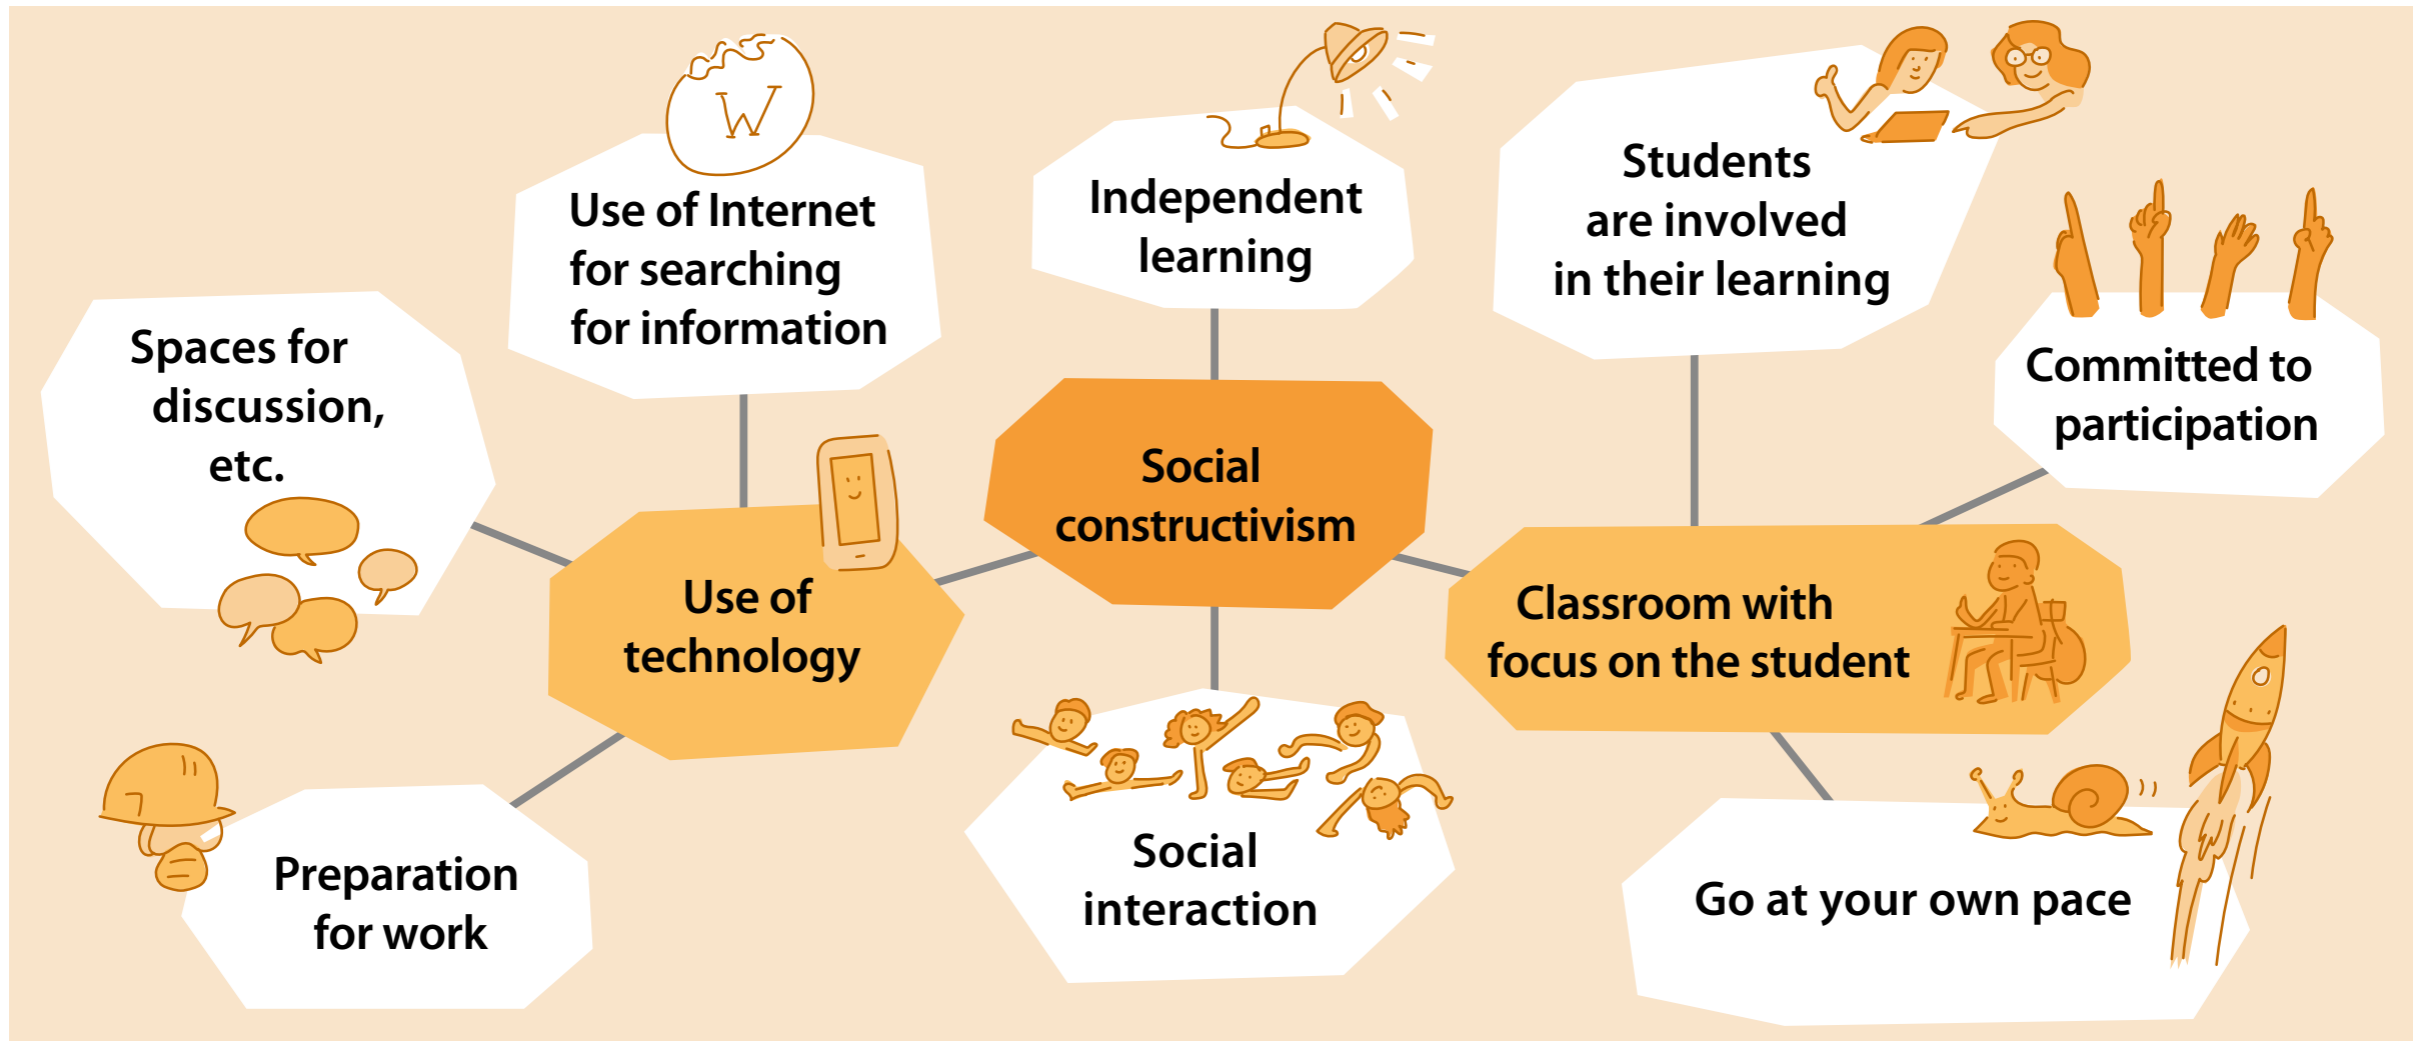

The teacher's knowledge takes priority over the students' questions.

There is little room for critical thinking. More dogmatic.

# Knowledge of science

According to the latest trends, the most important aspect is the **ability to understand**, and not knowledge in itself.

**What should science in schools be aimed at?**

Providing an intellectually, socially and academically attractive classroom environment that encourages students to ask reflective questions.

**For more information:** Chin and Osborne, 2008.

# What do we need to know about science?

## 10 principles of science education

**1.** At all stages of compulsory education, through its science education programmes, the systematic goal of schools should be to develop and maintain the students' curiosity about the world, to ensure that they enjoy science activities and that they understand natural phenomena.

**2.** The overall objectives of science education should be the participation of everybody in informed decision making and in actions that contribute to individual well-being and that of society and the environment.

**3.** Science education has several objectives, and should develop the following:

**a.** An understanding of the 'big ideas' of science, including the role of science and scientific ideas in society.

**b.** Scientific skills for obtaining and using evidence.

**c.** Scientific attitudes.

# What do we need to know about science?

- 4.** On the road to a science education, a clear path should be established, indicating the ideas that need to be achieved at each stage, the concepts that need to be worked on, and carefully analysing current research to help us understand how students learn.
- 5.** Progress towards great ideas should be the result of researching topics that are meaningful to the students or for their lives.
- 6.** Learning experiences should reflect the view of explicit scientific research in line with current scientific and educational thinking and scientific knowledge.
- 7.** All activities in the science curriculum should deepen the understanding of scientific ideas, and should also have other aims, such as developing scientific attitudes and skills.

# What do we need to know about science?

- 8.** The programmes, initial competences and professional development of teachers guiding student learning should be consistent with the learning and teaching methodologies set out in the objectives of the 3rd principle.
- 9.** Assessment plays a key role in science education. A formative assessment of student learning and a summative assessment of student progress should be applied to all objectives.
- 10.** To achieve these objectives, school science programmes should promote peer support among the teachers as well as community involvement, including that of scientists.

# Big ideas of science

Everything  
**MATTER**  
in the Universe is made up  
of tiny particles.

**One object**  
can affect  
another  
object from  
far away.

For an object to change  
its motion  
it must be acted on by  
an external force.

The universe always has  
the same amount of energy,  
but the energy can be  
transformed if something  
is changed or caused.

The composition of the Earth and the atmosphere,  
and the phenomena that occur in them,  
shape the Earth  
and influence  
its climate.

**The solar system** is a small part  
of one of the  
billions of  
galaxies in  
the universe.

Organisms  
are made up  
of **cells**.

Organisms  
require  
**energy and  
materials;**  
and are often dependent  
on and compete with  
other organisms  
for them.

Genetic information  
is passed from one **generation** of organisms  
to the next.

The **diversity**  
of living and extinct  
organisms is  
the result of  
evolution.

# What do we need to know about science?

## Ideas about science

1. Science considers that there is one or more causes of the same effect.
2. Scientific explanations, theories and models provide the best way to explain the facts known at a given time.
3. Scientific knowledge is applied in some technologies to create products that meet the objectives of humans.
4. Scientific applications often have ethical, social, economic and political consequences.

# What does the research say about science education?

## **Enseñando ciencia con ciencia** (*Teaching science with science*)

<https://www.fecyt.es/es/publicacion/ensenando-ciencia-con-ciencia>

February 2020 edition; published by FECYT and the Lilly Foundation  
Coordinators: Digna Couso, M. Rut Jiménez-Liso, Cintia Refojo and José Antonio Sacristán.

**Enseñando ciencia con ciencia** seeks to emphasise the need to connect science teaching practice with the abundant scientific research in this field. This interdisciplinary body of research, which brings together results from neuroscience, the psychology of learning, pedagogy and, above all, science education, provides us with scientific evidence and consensus on what we know currently works or does not work in science teaching and learning. The best way to learn science is to practice how it is done, and through discussion and reflection in the classroom.

1. Learn science by questioning ideas.
2. Advantages of cooperative learning.
3. Research, modelling and argumentation.
4. Teaching science to form free citizens.
5. Teach science without gender stereotypes.
6. Use controversial issues in the classroom.
7. "Neuromyths" in teaching and at work.

What does the research say about science education?

# 1. Learning science by questioning ideas

- Teaching science should help not only to explain personal or intuitive beliefs, but also to reconstruct or change beliefs through a dialogue with other more complex ways of knowing and thinking.

- In order for students to question their intuitions, they should be presented with problems, new situations that they cannot predict correctly, and be required to explain and make sense of their intuitions.

- To help students change their intuitive science, they must not be forced to abandon it because it is wrong, but rather to reconstruct it through dialogue with scientific knowledge, in a process of integration of knowledge.

What does the research say about science education?

## 2. Advantages of cooperative learning

- When group work results in real cooperation with peers, it produces better learning, not only in terms of social relations, but it also improves understanding and more autonomous learning.
- It is not enough just to have the students work in groups; cooperation must be encouraged through specific teaching strategies.

### Myths about group work:

- ✗ Group work dilutes individual responsibility and only those who are the most interested learn.
- ✗ It is enough just to have the students work in groups for them to learn cooperatively.
- ✗ It is better to form homogeneous groups of the same level, as they can progress together.

## What does the research say about science education?

### Advantages of cooperative learning

# Some ideas for encouraging cooperation in group work

- Form groups of 3-4 students.
- Heterogeneous groups.
- Set a clear goal, but one that cannot be achieved by a single student alone.
- Supervise the work of each group to ensure that individual responsibility is not diluted.
- Provide models and strategies for acquiring the social skills involved in cooperative behaviour, clearly illustrating which behaviours are cooperative and which are not.
- Prevent the groups from adopting strategies in which each student does what they do best.
- Supervise the social interactions that take place within the group and the dialogue about the scientific contents being worked on, in order to optimise both learnings.

What does the research say about science education?

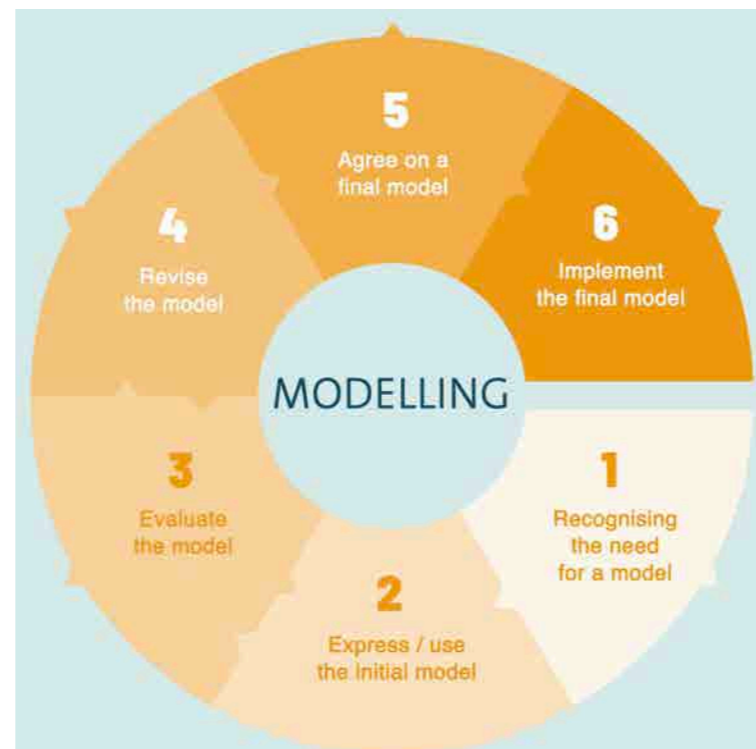

# 3. Research, modelling and argumentation

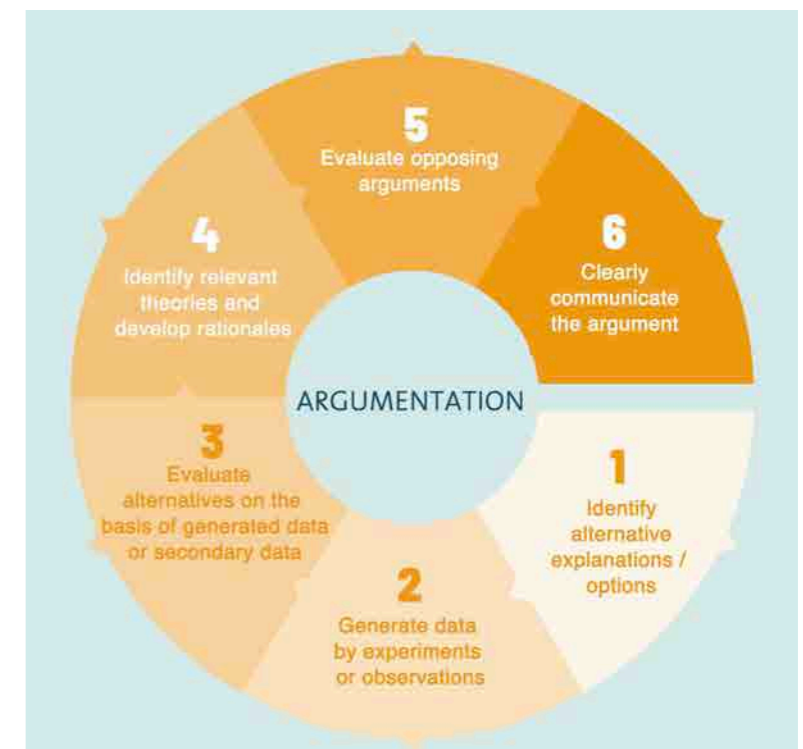

The scientific practices most recommended by didactic research are: research, modelling and argumentation.

Research

Modelling

Argumentation

## What does the research say about science education?

### Research, modelling and argumentation

With the guided research teaching model, students learn scientific content, learn to do science (procedures), learn what science is and how it is built. This generates a positive attitude towards science and, above all, it helps the students to develop critical thinking, i.e. To question any statement that is not supported by evidence.

### Research, modelling and argumentation

Modelling processes allow us to "devise" interpretive models that serve to describe, predict, explain and intervene in phenomena in accordance with what we know and the available evidence and that can be transferred to other contexts.

### Research, modelling and argumentation

Argumentation is the assessment of knowledge based on evidence. In today's world, in which there is a whole host of unproven pseudoscientific claims and hoaxes, argumentation is a tool for developing critical thinking.

## What does the research say about science education?

# 4. Teaching science to form free citizens

- STEAM education, based on dialogue, reflection and critical thinking, allows for the processes of democratisation of scientific and technological knowledge to be practised in the classroom.
- Selecting correct, unbiased information in an environment in which we are constantly bombarded with fake news and "truths" from pseudoscientific gurus, is key to teaching science in the post-truth era. This aspect is particularly important as regards one of the key skills for our present and future science: communication, understanding science as a universal right that should be available to all; to be part of all of us.
- Teamwork in a STEAM environment, based on an interdisciplinary approach, provides a unique opportunity for developing:
  - multiple approaches,
  - a global awareness of science,
  - a fertile ground for fostering a creative approach to identifying and solving complex problems,
  - a fundamental tool for the social construction of our future.

**Science is, without a doubt, a common good that protects us, drives us and humanises us.**

## What does the research say about science education?

# 5. Teaching science without gender stereotypes

## Research should include:

Girls. At a very young age (around 6 years) they already think that they are less intelligent than their male classmates.

There are two types of stereotypes: explicit and implicit. The latter are deeper, unconscious, and have a powerful influence on our behaviour. These are the stereotypes that perpetuate, for example, the belief that science is a male activity.

Female role models can help girls take an interest in STEM disciplines.

Girls do not seem to perform as well as boys in highly competitive environments.

## What does the research say about science education?

### Myths about teaching science, from a gender perspective:

- ✗ Science (and science education) is unbiased, as it is a completely objective discipline.
- ✗ There is no need to focus girls' education on STEM disciplines. They don't choose them because they don't like them.
- ✗ Teachers at all levels of education are unbiased when assessing the abilities of their students.
- ✗ These gender stereotypes cannot be remedied.
- ✗ The abilities of girls and boys are innately different.
- ✗ Countries that are more advanced in terms of gender equality have more women interested in STEM disciplines.
- ✗ Women who pursue STEM careers advance in the same way as men.
- ✗ Environmental problems and natural disasters affect men and women equally.
- ✗ There is no gender bias in environmental and civic education in schools.

## 6. Discussing controversial issues in the classroom

**Discussing controversial socio-scientific issues in the classroom provides a teaching opportunity for:**

- relating scientific ideas to the world of the students
- ensuring that the science we teach is useful
- not only understanding and decision-making, but also for acting as free, autonomous citizens.

Controversial socio-scientific issues are open-ended issues whereby the students make a decision that involves both scientific and social aspects, such as the management of environmental, bioethical or techno-ethical problems.

Whether or not to use nuclear energy, whether to make vaccination compulsory or whether to allow homeopathic products to be sold in pharmacies are issues that we should all be able to take a position on.

These dilemmas are not only associated with science, but also to ethical considerations and personal and social values.

What does the research say about science education?

## 7. “Neuromyths” in teaching and at work

Some of the most widespread myths about the brain in society:

**X** We only use 10% of our brain.

**X** Adapting our **teaching methods** to students' learning styles facilitates their learning.

What helps determine how to teach is the type of content or skill we want to teach, not the “learning style” of each student.

**X** There are **left-brain** learners and **right-brain** learners.

**There is no evidence** that the differences between people in terms of creativity, logic or ability to emote are linked to different processing in the right and left hemispheres of the brain.

**X** **Listening to classical music**, especially Mozart, increases students' intelligence.

**X** Young people who have been born and raised surrounded by technology are “**digital natives**”.

**X** **Exceptionally stimulus-rich environments** improve children's brains.

FALSE

TRUE

# Schools in the Basque Country

## What are the elements of effective low and middle socioeconomic level schools?

### SCHOOLS

- Positive environment No major problems, working at ease
- Vision: clear, participatory, respected
- Clear leadership: management team
- Effective management, coordination
- Culture of assessment: projects
- High expectations for students and teachers
- Harassment is dealt with
- The staff is united
- The staff is stable
- It is attentive to diversity

Source: *Irakas-sistema ebaluatu eta ikertzeko erakundea (ISEI-IVEI)*

# Schools in the Basque Country

## What are the elements of effective low and middle socioeconomic level schools?

### STUDENTS

- Direct follow-up through tutoring
- Direct involvement of families
- Effective attention to student diversity
- Attention to students with special needs
- Plurality of methodologies: effective use of books and ICTs
- A rooted culture of assessment

# Schools in the Basque Country

## What are the elements of effective low and middle socioeconomic level schools?

### TEACHERS

- Dedicated and involved
- Motivated for training and continuous improvement
- Work on quality projects
- Well looked after
- Highly engaged

# STEAMGUNEA

**STEAMGUNEA offers information, resources and templates to help schools create their STEAM plans.**

**This tool was created in 2019 by the Department of Education of the Basque Government.**

# STEAM EDUCATION BEYOND SCHOOL

# STEAM EDUCATION BEYOND SCHOOL

- **Fairs, museums, visits, etc.**
- **Family and peers**
- **Scientific capital**
- **STEM role models**

# Fairs, museums, visits, etc.

Out-of-school **STEAM** experiences improve science literacy

Field trips

Family activities

Attendance at science fairs, visits to museums, etc.

Studies show that these activities have the following **benefits**:

A better understanding of science concepts.

Promote experiential learning.

Access to up-to-date materials and tools

Allow work on the most critical and social aspects.

Allow work on the **more transversal values** of scientific knowledge:

Mae Jemison  
American engineer,  
doctor and  
astronaut.

- To correct incorrect stereotypes.
- To increase the perception of effectiveness, especially in girls.

Fuente:  
"Enseñando ciencia con ciencia"

# Family and peers

- **Parents, with their beliefs and expectations**, play an important role in shaping girls' interest and their attitudes towards STEM-related studies. **Parents with traditional beliefs about gender roles**, and who treat girls and boys unequally, **can reinforce negative stereotypes** about gender and ability in STEM.
- **The expectations of parents (especially mothers)** influence the educational and career choices of girls more than boys.
- **Higher socio-economic status and parental educational qualifications** are associated with higher scores in mathematics and science (girls and boys). Mothers with higher educational qualifications positively influence girls' achievement in science. Other family members can also influence girls towards STEM.
- **Girls' participation in STEM is also influenced by the socio-cultural context of the family:** ethnicity, language, immigration status, and family structure.
- **Girls' motivation for STEM education is also influenced by their peers;** especially female peers.

**Source:** *Cracking the code: Girls' and women's education in science, technology, engineering and mathematics (STEM); UNESCO, 2019.*

# Family and peers

## Suggestions for opening STEM up to girls and boys

Lay the foundation for early learning and interest

Involve parents, caregivers and family

Counteract preconceived ideas

Promote dialogue between parents and children

Parents can actively support their children's preparation and motivation to pursue STEM disciplines.

# Science capital

**Science capital** refers to people's level of commitment to science and their relationship with it: how much they value science, to what extent they see the **connection between science and their lives**, to what extent they feel that science is 'for them', and how 'safe' they feel with science topics.

- All citizens need **scientific skills**.
- We need to **overcome** *this "I'm more arts" and "I'm more science" divide.*

## Science capital

- **Science capital of families:** Young people from families with high science capital are more likely to pursue STEM careers than young people with low science capital.

This situation prevents breaking with the homogeneity of the type of professionals in STEM.

- **Low science capital means that they are not aware of the many different STEM occupations..**

Most young people are only aware of the most common STEM occupations: scientists, engineers, teachers, etc. As a result, **they think (mistakenly) “STEM is not for me”.**

# How to increase people's science capital

Eight aspects for increasing science capital:

## 1 Science literacy

## 2 Attitudes, values and trends in science

## 3 Knowledge about the transferability of science

## 4 Use of science resources

## 5 Participating in extracurricular activities to learn science

## 6 Skills, knowledge and qualifications of the family

## 7 Meeting people who work in science

## 8 Talking about science in everyday life

Each of these aspects can help us to design and offer better activities for STEAM education

# STEM role models

- **The stereotypical image of STEM professionals and STEM studies discourages many young people.**
- Young people believe that STEM professionals are: "very smart", "nerds" and "freaks/geeks"; and therefore think *"I'm not like that and this is not for me"*.

It is unlikely that anyone who is not considered the "smartest" in school will want to study science.

Students are more likely to show a preference for science if they are male and white, and if they have high or very high cultural capital, because they feel identified with this image.

- Equality issues, and especially gender issues, are also **evident at a young age.**
- **Girls choose STEM studies** less often than boys, but a higher percentage of **girls like science from an early age.**

# STEM role models

• It is unusual for “feminine” (or very feminine) women to opt for STEM studies.

WE'RE  
SCIENTISTS.  
SO WHY NOT YOU?

• Female role models can encourage girls to pursue careers in STEM disciplines.

• Female teachers seem to be more effective at encouraging girls to pursue STEM careers.

It is recommended, especially with girls, to carry out extracurricular STEM activities, or activities involving role models, such as meetings with them, videos or presentations of success cases.

STEM  
might be for me

## SCIENCES

### Biology

Food microbiology analyst • Scientific animator • Environmental auditor • Biostatistician • Bioinformatician • Health biologist • Nutrigenomics counsellor • Genetic counsellor • Breeder of insects for natural control • Algae farmer • Environmental communicator • Biofuel specialist • Environmental and chemical safety specialist • Gene therapy expert • Aquaculture farm manager • Technology transfer manager • Farm school monitor • Neurobiologist • Oceanographer • Environmental journalist • Quality manager • Stem cell technician • Air pollution control technician • Integrated agricultural and ecological production systems technician • Agricultural soil restoration technician • Food safety management technician • Research support technician • Gene therapy technician • Waste treatment technician • Technician in environmental management systems • Integrated pest control management technician • Technical specialist in planning, management and organisation of natural areas • Health visitor

### Statistics

Digital analyst • Analyst of economic and management studies • IT technical advisor • Biostatistician • Data scientist • Chief data officer • Lecturer • Big Data specialist • Medical statistician • Expert in customer satisfaction measurement • Statistician in data centres and sociological companies and consultancy firms • Planning technician in service companies or any kind of company • Market research technician • Data processing technician • Prospecting specialist

### Biochemistry

Environmental auditor • Water analyst • Biochemist • Biomaterials specialist/researcher • Pharmaceutical marketing specialist • Gene therapy expert • Clinical trials monitor • Laboratory technician • Clinical analysis technician • Food industry technician • Pharmaceutical industry technician • Quality control technician • Biotechnology marketing manager • Environmental technician • Waste treatment technician • Technology platform manager • Pharmaceutical product manager • Stem cell technician • Research and development technician • Pharmaceutical development technician • Crystallography, nanotechnology, proteomics or sequencing technician/specialist • Health visitor

### Physics

Systems analyst or programmer • Cloud architect • Environmental auditor • Acoustics consultant • Data scientist • Software developer • Laboratory manager • Production manager • Lecturer • Big Data specialist • Systems biology specialist • Cyber security specialist • Cloud specialist • Medical physicist • Biomaterials researcher • Meteorologist • Drone pilot • Applications programmer • Energy and alternative energy technician • Quality technician • R&D technician • Specialist in developing data transmission equipment and networks • Specialist in developing telephony and telecommunications equipment • Environmental technician (control of air and noise pollution, management systems) • IT technician • With MBA training: sales, company director or advisory consultant

### Biotechnology

Novel foods research specialist • Clinical trial monitor • Neurobiologist • Regulatory affairs manager • Biotechnology communications manager • Pharmacoeconomics manager • Biotechnology marketing manager • Bioinformatician • Nutrigenomics counsellor • E-Health consultant • Biofuels specialist • Systems biology specialist • Catalytic processes and catalysis specialist • Gene therapy expert • Biomaterials researcher • Industrial property manager specialised in biotechnology • Technology transfer manager • Technology surveillance manager • Analytical technician • In-vitro assay technician • In-vivo assay technician • Stem cell technician • Technical specialist in crystallography • Technical specialist in nanotechnology • Technical specialist in proteomics • Technical specialist in Sequencing

### Mathematics

Data analyst • Analysts • Programmers • Risk analyst • Digital archaeologist • Big Data architect • Risk Analyst • IT advisor • Technical advisor • Mechanical astronomer • Data scientist • Coders • Mobile application developer • Big Data specialist • Cyber security expert • Computer scientist • Mathematician • Numerical methods • Geodesy technician • Computer science technician • Quality control technician • Cryptography technician • R&D technician • Financial technologist • Communication networks

### Geology

Geologist • Marine geologist • Public works geologist • Borehole geologist • Geophysicist • Geochemist • Hydrogeologist • Seismologist • Volcanologist • Mineralogist • Sedimentologist • Palaeontologist • Geological engineer • Construction project analyst • Geological resources analyst • Cartographer • Occupational risk prevention expert • Environmental manager • Environmental auditor • Geographical information systems specialist • Geohistorian

### Environmental sciences

Environmental auditor • Acoustic consultant • Algae farmer • Environmental reporter • Environmental educator • Biofuels specialist • Geographical information systems specialist • Environmental manager • Aquaculture farm manager • Environmental interpreter-guide • Environmental journalist • Secondary school, university or vocational training teacher • Technical specialist in sewage and wastewater treatment • Water control technician • Technical specialist in environmental restoration • Technical specialist in treatment and recycling of MSW • Technical specialist in integrated analysis and control of river pollution • Technical specialist in control of air pollution in industrial installations • Technical specialist in sustainable management of natural spaces • Technical specialist in planning and development of natural spaces • Technical specialist in energy efficiency in construction • Environmental technician

### Optics / Optometry

Optician • Optical technician • Technical director at optical establishments • Technical director at optometric centres • Optics and optometry key account specialist • Optometrist in ophthalmology and refractive surgery services (public or private) • Visual screening technician • Specialist in the study, design and manufacturing of optical components • Optical and electronic equipment operator • Medical visitor • Occupational health and safety technician • Photogrammetry technician • Holography technician • Trainer in non-official courses • Educator

### Food science and technology

Quality control laboratory technician • Food quality control technician • Food industry technician • Food microbiology analyst • Food counsellor • Nutrigenomics counsellor • Sensory analysis specialist • Food establishment evaluator • Food establishment expert • Food packaging applications expert • Fair trade expert • Expert in integrated quality management, environment, occupational risk • Food legislation expert • International food sales manager • Wholesale food sales manager • Customer and consumer communications manager • Novel foods research specialist • Industrial catering supervisor • Food additives and flavourings sales technician • Food safety technician • Technical specialist in nutritional information

### Chemistry

Water analyst • Environmental auditor • Food advisor • Process controller • Product specialist • Biofuels specialist • Geochemist • Biomaterials researcher • Chemist • Quality control technician • Environmental technician • Chemical safety technician • Waste and water treatment technician • Renewable energy technician • R&D+I technician • In-vitro assay technician • Clinical analysis technician • Laboratory technician • Technician in the food and pharmaceutical industries • Health visitor

# The Amazingly Enormous STEM Careers Poster

Based on the education system and needs of UK society

# STEAM, GIRLS AND WOMEN

# STEAM, GIRLS AND WOMEN

- The situation of women in STEM studies

- Factors influencing participation of women.

- Promoting women's interest in STEM

# Situation of women and girls in the world

Throughout the world

women suffer more inequality and poverty.

## Influencing factors:

- Social, cultural and political factors

- Income disparity and wage gap.

- Girls have less access to education.

- The double shift.

Women and girls account for 60 percent of the people who are chronically hungry in the world

Source: The World's Women 2015. Trends and Statistics. UN

# Status of women and girls in STEM studies

## Girls are left behind

very soon in STEM education, from early childhood, in games related to the theme.

## Girls lose interest

more and more between the first and last years of adolescence.

In higher STEM education, young women account for only

**35 %**

worldwide.

There are important differences in female representation in STEM studies between countries, suggesting contextual factors

The percentage of **abandonment** of STEM disciplines at university and at work is **much higher** in women.

Women do not pursue **STEM** professions, despite the time and energy invested in their education.

Reasons:

- Perception of **incompatibility** with female identity.

- Social allocation to women in family care.

- Environment and working conditions.

PISA 2015:

Girls were **three times** more likely than boys to work in **health-related** professions, while **boys doubled** the girls in seeing themselves working in **engineering**.

Source: "Decipher the code. The education of girls and women in science, technology, engineering and mathematics (STEM)". UNESCO, 2019.

# Worldwide data

**Significant gender differences in higher education enrolment by area of study.**

Proportion of female and male students enrolled in tertiary education, by field of study, world average

Source: "Decipher the code. The education of girls and women in science, technology, engineering and mathematics (STEM)". UNESCO, 2019.

# Worldwide data

**Only 30% of all students select STEM-related fields in higher education.**

Distribution of female students enrolled in higher education, by field of study, world average

Source: "Decipher the code. The education of girls and women in science, technology, engineering and mathematics (STEM)". UNESCO, 2019.

# Worldwide data

**Most 15-year-old girls who intend to pursue scientific careers expect to work as health professionals.**

Expectation to work as **science and engineering professionals.**

Expectation to work as **health professionals.**

Expectation to work as **ICT professionals.**

Expectation to work as **technicians related to science, or associated professionals.**

Expectations of students in science careers (age 15), world average

Data source: PISA 2015 (OECD countries) <sup>17</sup>

**The gender gap is widening significantly among scientific researchers.**

Proportion of women and men in higher education and research, world average

Data source: UNESCO 2008-2014 <sup>11</sup>

## STEAM Vocations in the BAC

# Gender gap in STEM careers:

	Men		Women		Total
	Number		Number		Number
Arts and human sciences	2,328	38 %	3,868	62 %	6,196
Science	1,958	48 %	2,136	52 %	4,094
<b>Health sciences</b>	<b>2,062</b>	<b>24 %</b>	6,690	<b>76 %</b>	8,752
Social and legal sciences	13,561	42 %	19,059	58 %	32,620
<b>Engineering and architecture</b>	10,958	<b>73 %</b>	<b>4,137</b>	<b>27 %</b>	15,095
<b>TOTAL</b>	<b>30,867</b>	<b>46 %</b>	<b>35,890</b>	<b>54 %</b>	<b>66,757</b>

Students enrolled at universities in the Basque Autonomous Community. 2012/2018

\*Degrees, Master's and Doctorates

PISA 2015

ICT career intention:

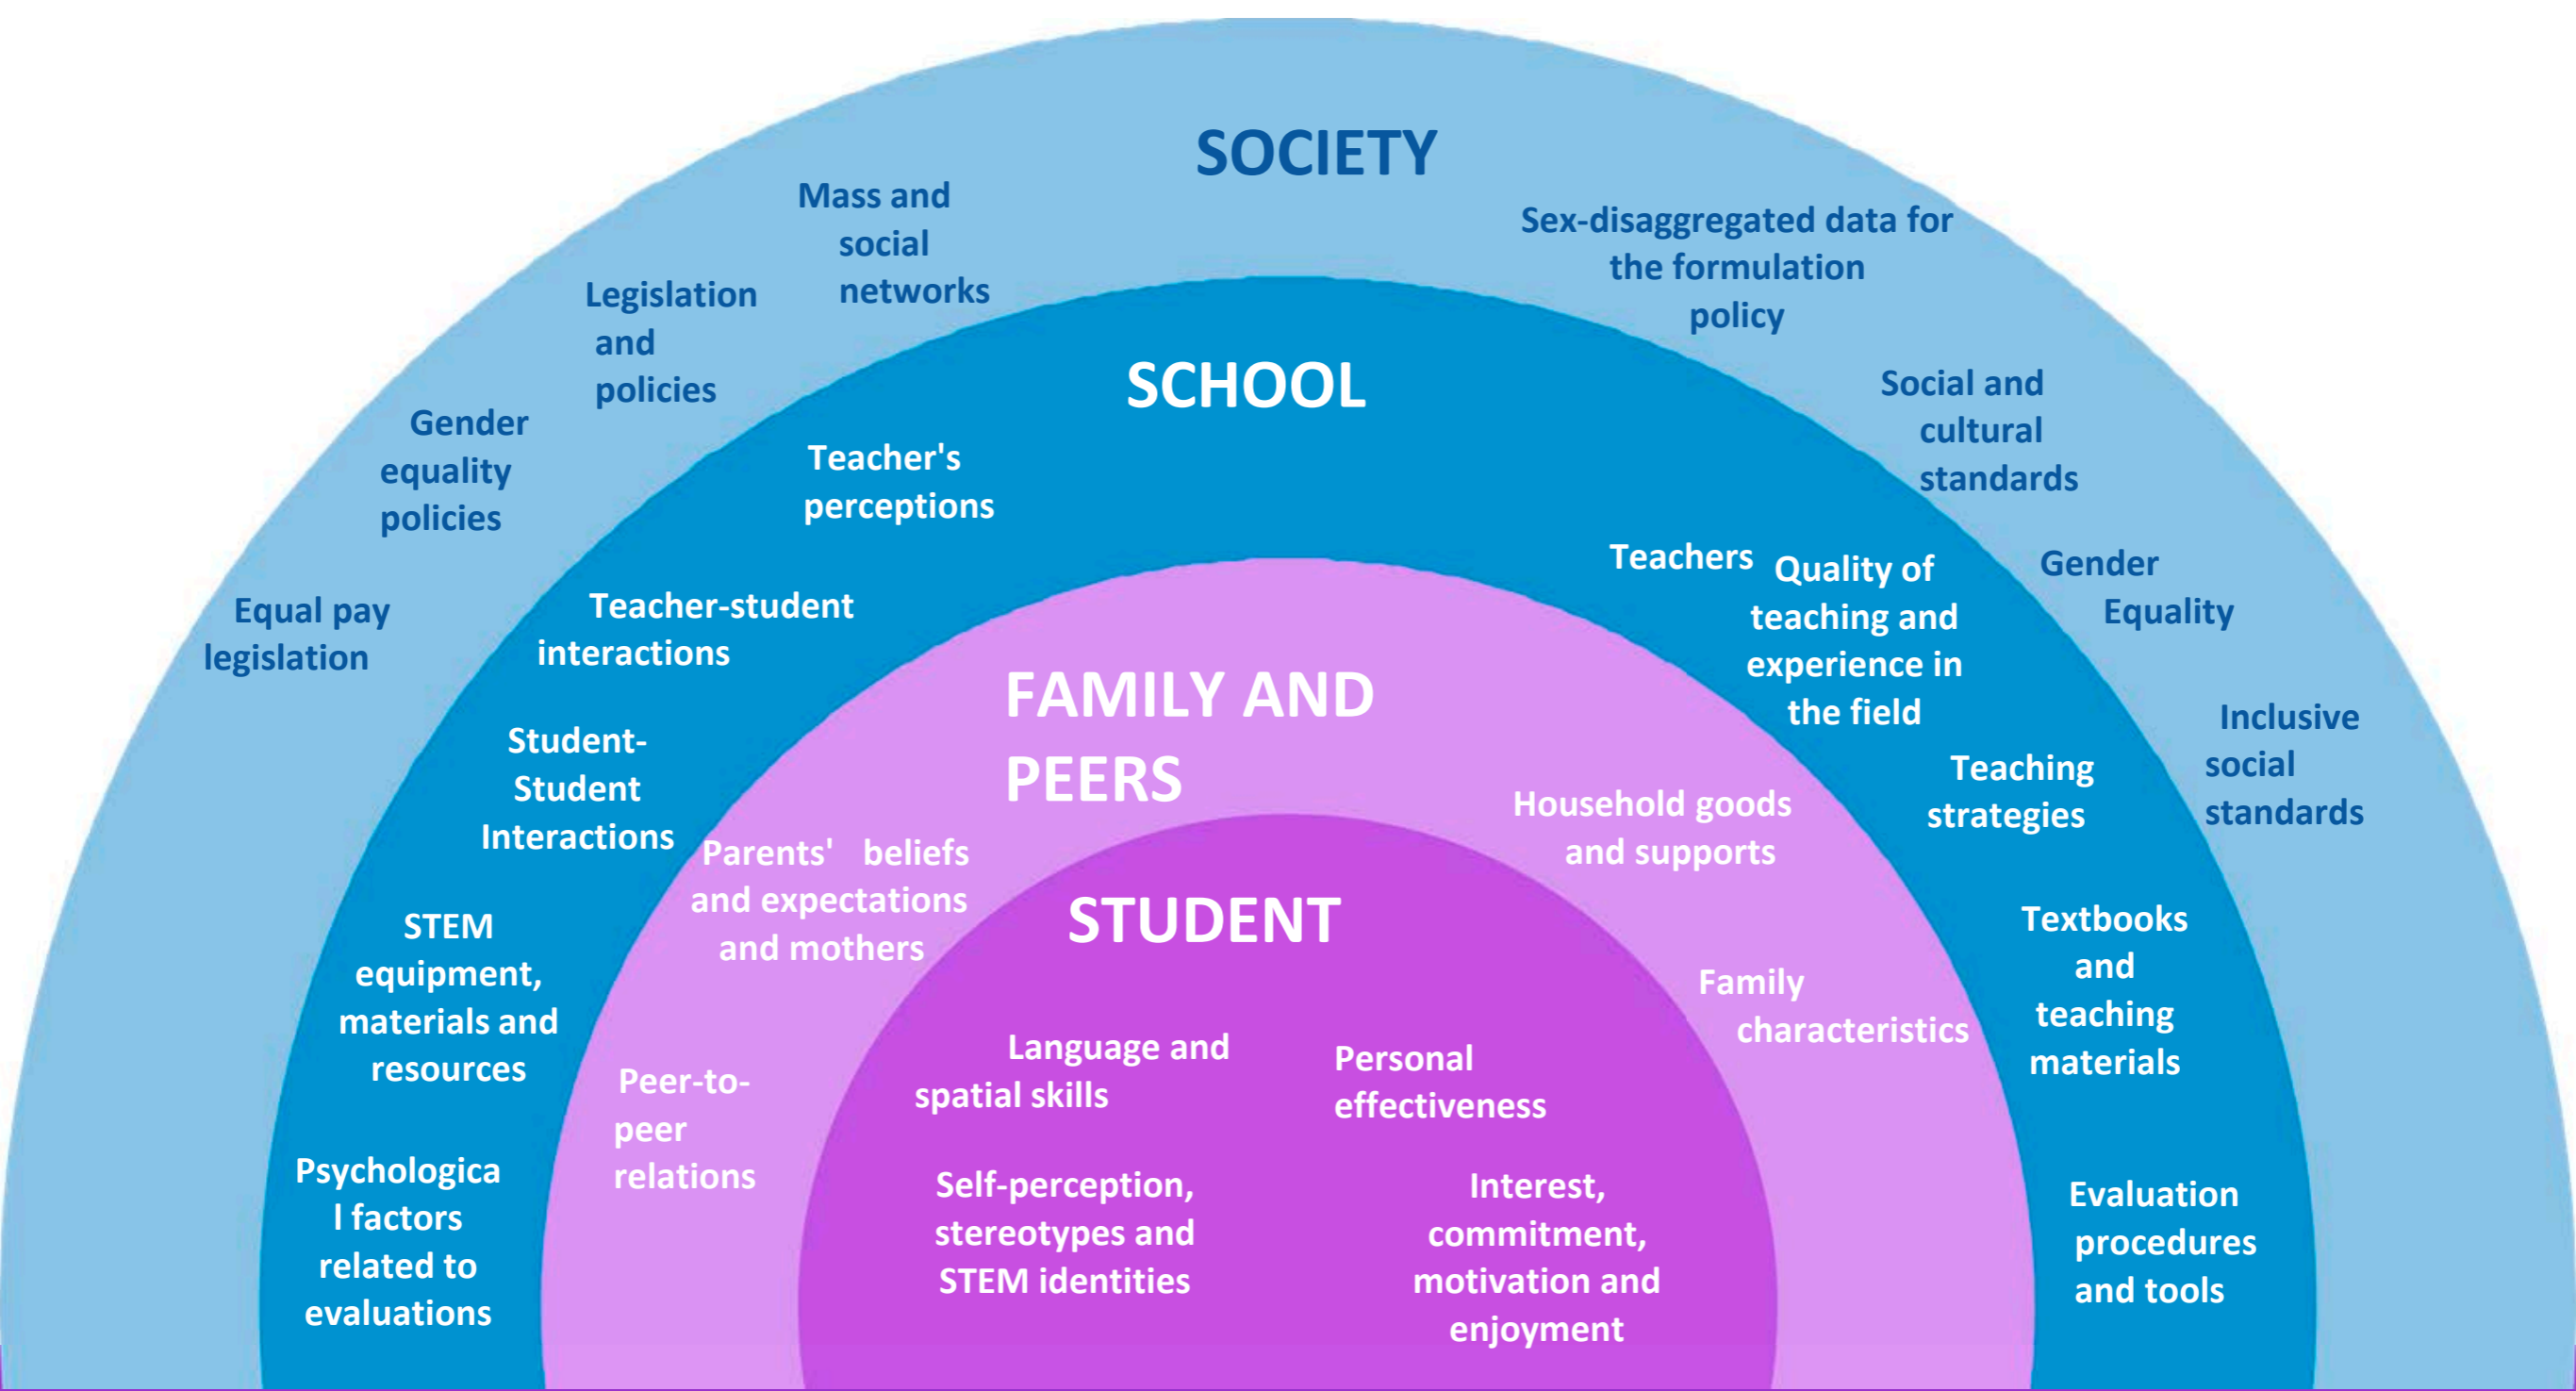

4.8% of boys

0.4% of girls

According to PISA 2015 results, 4.8% of boys and 0.4% of girls aspire to an ICT career.

# Factors affecting participation of women and girls

Ecological framework of factors influencing female participation, performance and progression in STEM studies

# Individual, family and peer factors

No neural differences in learning

Studies suggest **growing interest in STEM** in girls' childhoods.

## FAMILY AND PEER FACTORS

The role played by the family and its extensions in the attitude of girls towards STEM is also very important.

Parents' beliefs and expectations influence their children

- The educational level and profession of the parents.

- The degree of support at home.

- Parents with traditional beliefs that treat girls and boys unequally may reinforce negative stereotypes about STEM skills.

- The expectations of mothers have a great influence on the girls' career choices.

- The socio-economic situation of the family is associated with better marks in STEM.

- The socio-cultural situation family also influences the future STEM of the children.

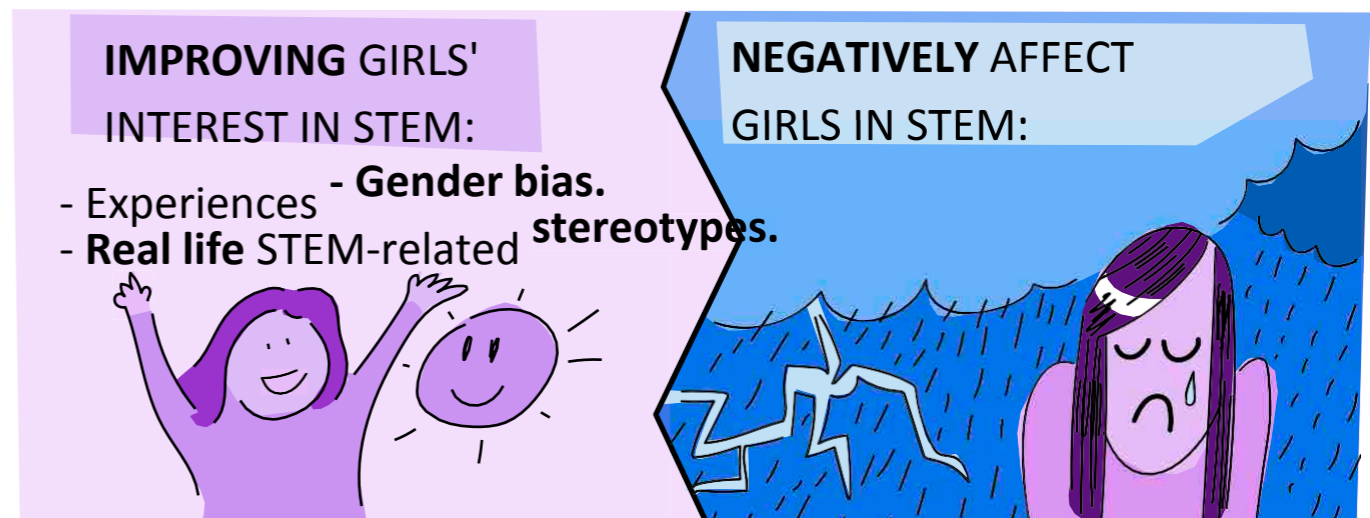

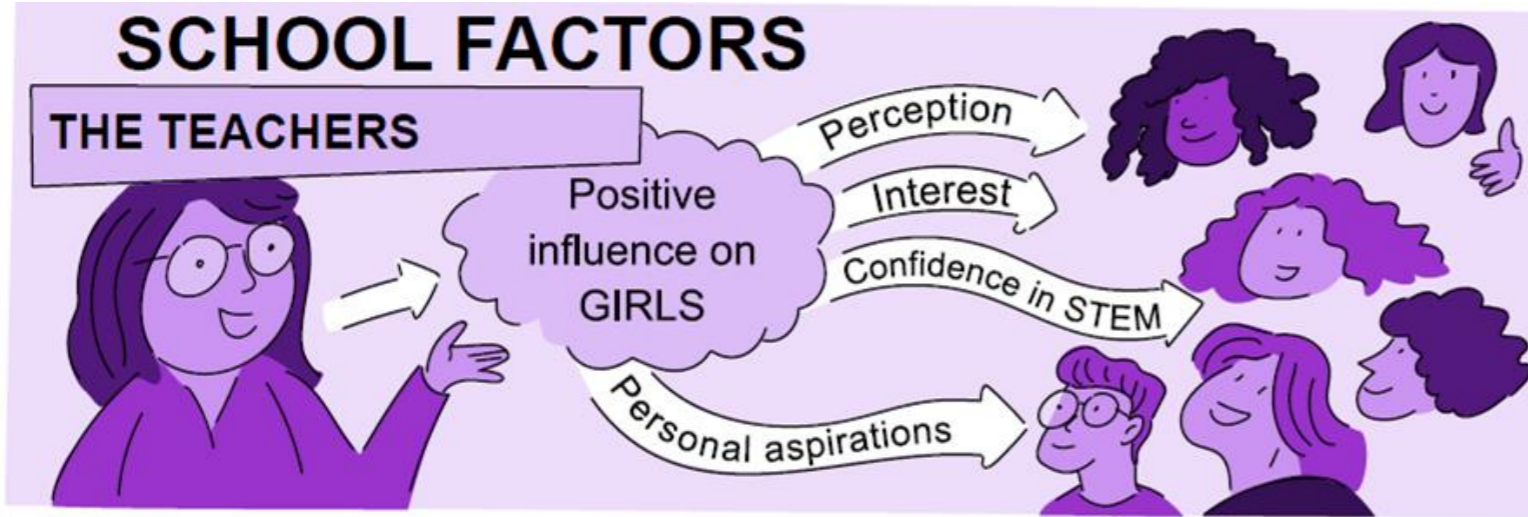

- Peers, especially women, also influence girls' interest in STEM.

# School factors

# Social factors

**Cultural and social norms** influence the aspirations of **girls**.

In countries with more **gender equality**, girls have more positive attitudes towards STEM.

The **measures** to promote **gender equality**:

- Fees
- Incentives
- ...

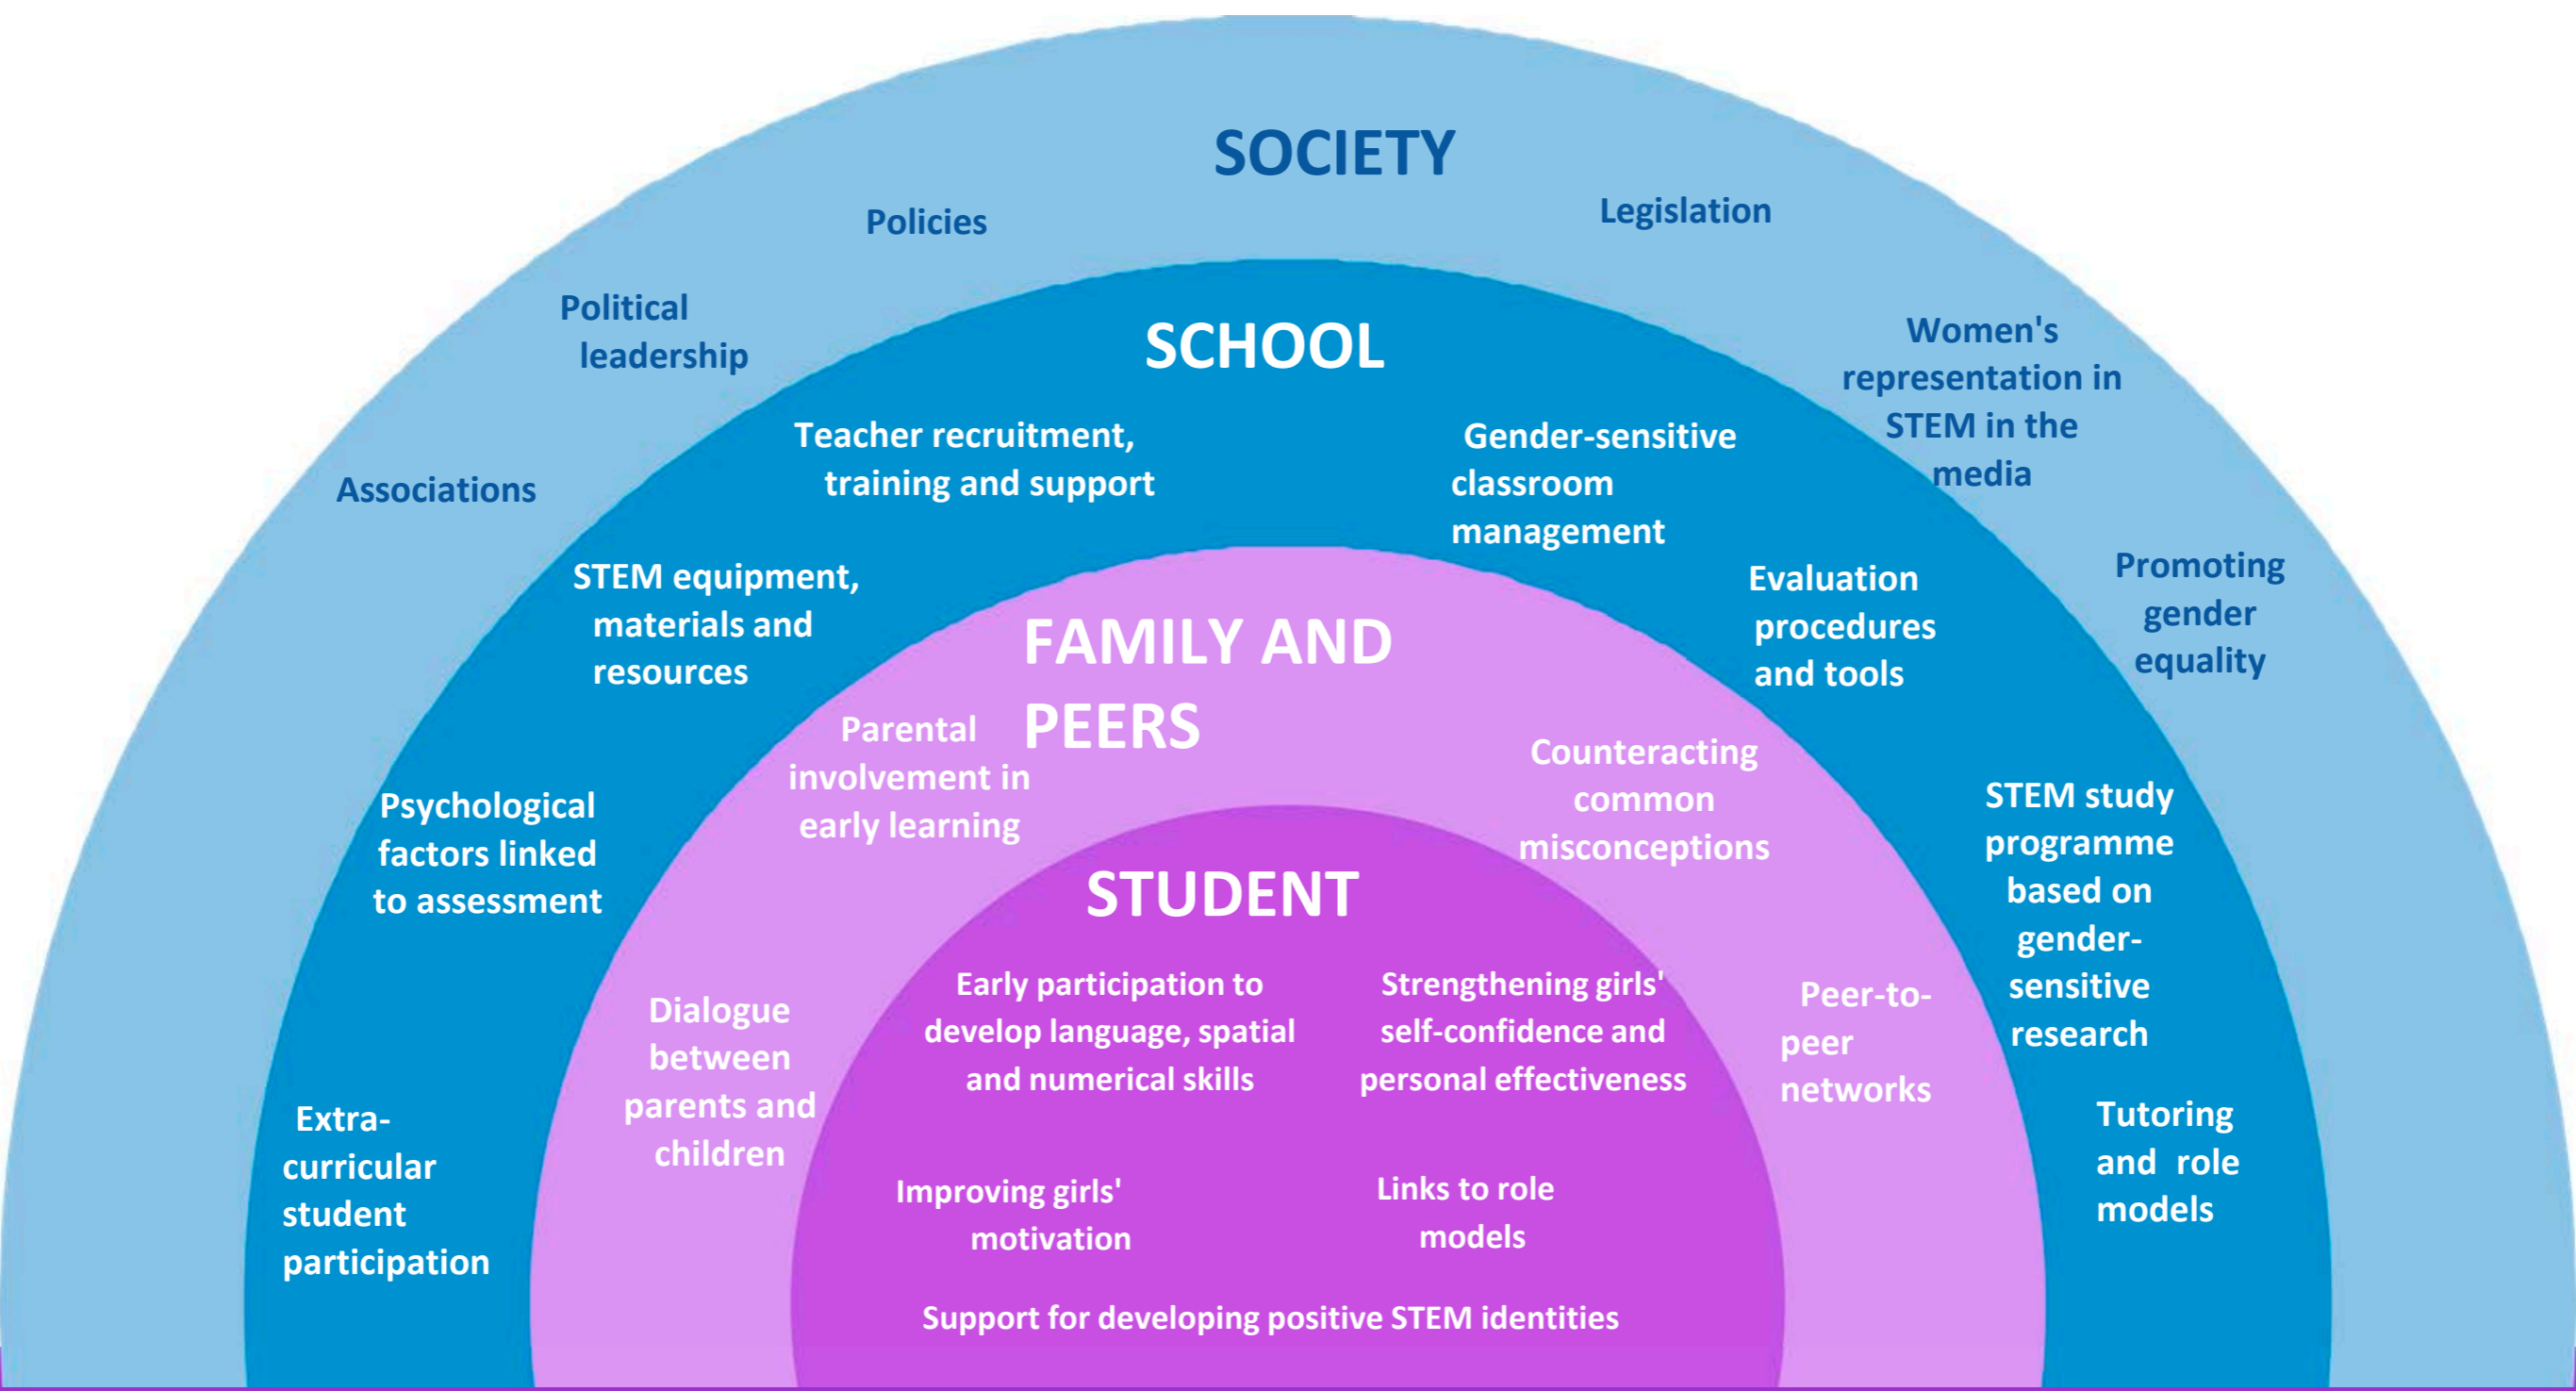

increase **female participation** in STEM.

**Gender stereotypes** in the **media** affect **children** and **adults**.

# Promoting women's interest in STEM

Interventions that help increase girls' and women's interest in and commitment to STEM education.

# Interventions at school and on social level

## SCHOOL

- Improving the system.
- Preparation of **teachers**, training, **mixed**.

## BUILDING "SCIENTIFIC IDENTITY" AMONG GIRLS

- Explaining that **science is FOR EVERYONE**.

- **Avoiding hierarchy of males**.
- **Involving girls** in practical and theoretical attitudes

- **Experiences**, laboratory, computers, technology...

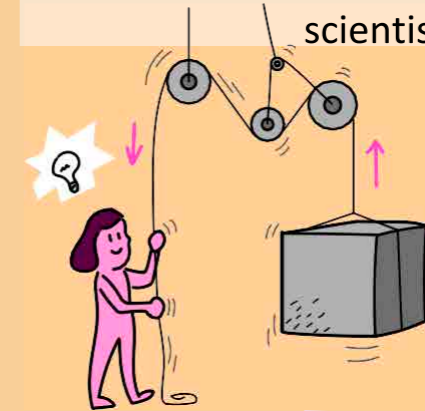

- Extracurricular activities.

- Creating a **safe and relaxed atmosphere**.

## MUSEUMS, CENTRES, CAMPS, TRIPS...

Better understanding of the concepts scientists.

Learning through experience and **practical activities**.

**Avoiding negative stereotypes**

Providing professional **guidance** with a gender perspective.

## VOCATIONAL GUIDANCE COUNSELLORS

- They can **increase STEM motivation** in girls.
- They can **collaborate** with family, friends and teachers.
- They can help with **school and family initiatives**.

## INTERVENTIONS ON SOCIAL LEVEL

More **SCHOLARSHIPS**

**Public policies and legislation**

**Positive images of STEM women**

**Creating partnerships**

# Recommendations for teachers

## Let's know our STEAM biases

We may apply **unconscious biases** towards the students,

...and that may hurt someone.

Let's strive to locate if we treat some of them in a **Different way,**

or if we expect **something less** from some

We can record a video for **analysis.**

## Let's build trust

Showing **confidence in their abilities** is positive for learners.

## Let's take advantage of the interests of the students

We can build bridges between your out-of-school interests and **STEM experiences.**

We encourage students to express their ideas in a different way: presentations, role-playing, drawings, etc.

## Let's group them in a different way

In STEM activities, let's offer them the opportunity to work with boys and girls from **different** backgrounds and languages.

## Let's present examples of STEM professionals

Let's show students **examples of diversity,** avoiding the stereotype of the brilliant scientist.

**Let's promote contact between students and STEM professionals** (if possible, not just white males), at school and at work

Prepare a short personal interview (motivations, etc).

## Let's analyse news about STEM

Let's go over them with the students, taking into account gender, diversity, etc.

**EXPERIENCES  
AND  
COMMUNITY**
